1.1 Purpose

The purpose of this document is to provide an end-to-end process flow and requirement for the Hour Log Adjustment functionality across the Farm App (Web and Mobile) and ERP. This document should be used as guidance during detailed design, build, and other project-related activities. This document aims to provide a solution baseline and to lock the baseline solution approach from the process flow perspective.

1.2 Scope

This document covers the hour log adjustment process only: how the machine operator raises a change to the hours the mobile app recorded against a work order, and how the farm manager reviews and decides that change on the web app. Work order creation, progress capture and area completion are covered in their own documents.

1.3 Audience

The primary audiences for this document are Folio3 project executives, management, and wider implementation teams.

1.4 Functional Assumptions

These workflows will be used as a primary design artifact to confirm existing (delivered) functionality. It is assumed that the work order, its fields/plots, its resources and the machine and implement master data already exist, and that the mobile app already records the job start and end time when the operator starts and pauses a job.

Executive Summary

This document is created to fill the gap between teams in the understanding of the Hour Log Adjustment flow, its functionality, and the stages the data goes through between the mobile app, the web app and ERP.

Introduction

Problem Statement

Currently, if resource hours are incorrect or missing in the mobile app, the operator cannot adjust them directly. The operator has to inform the manager, who then manually finds the relevant resource entry and corrects the hours from the web app. This becomes time-consuming when the manager has to handle hour corrections for multiple resources, and there is no proper request, approval, or audit trail for these changes. .

Solution Overview

The Hour Log Adjustment feature will allow the operator to raise an hour adjustment request directly from the mobile app. The operator can either request a change against an existing hour entry or add a new entry if the hours were not captured at all. While creating the request, the operator will select the relevant field, enter the correct job start and end date/time, select one or more machines and any applicable implements, and provide a reason for the change. The system will automatically calculate the duration, and the submitted request will not update the actual spent hours until it is reviewed by the manager.

On the web app, the manager will be able to see pending hour adjustment requests against each resource and review the original logged hours alongside the hours requested by the operator. The manager can then approve the request as submitted, adjust the requested time or machine/implement details before approval, or reject the request with a reason. If the approved time overlaps with another entry for the same resource and machine, the system will handle the overlap during the manager's decision. Once approved or adjusted, the decided hours will update the resource hour log and will also be reflected back on the mobile app. Each decision will be recorded in the audit log for traceability.

Summary

The Hour Log Adjustment solution replaces verbal hour corrections with a request-and-approval process between the Farm Mobile App and the Farm Web App.

The operator raises a new entry or a change to an existing entry with the machines, the implements and a reason; the manager approves, adjusts or rejects it; the decided hours are written into that resource's hour log, the mobile hour log is updated with them, and an audit log entry is created with the reason. Overlapping time is caught and redistributed at the point the manager decides, not in the field.

The document is intended for use by development, QA, functional, and design teams to ensure cohesive and effective feature implementation.

Workflow

Mocks (For Prototype Click Here)

Hour Log Adjustment (Mobile App) – Machine Operator

The mobile interface is used by the machine operator. It is a tab on the work order, so the operator raises the change from the same place he runs the job.

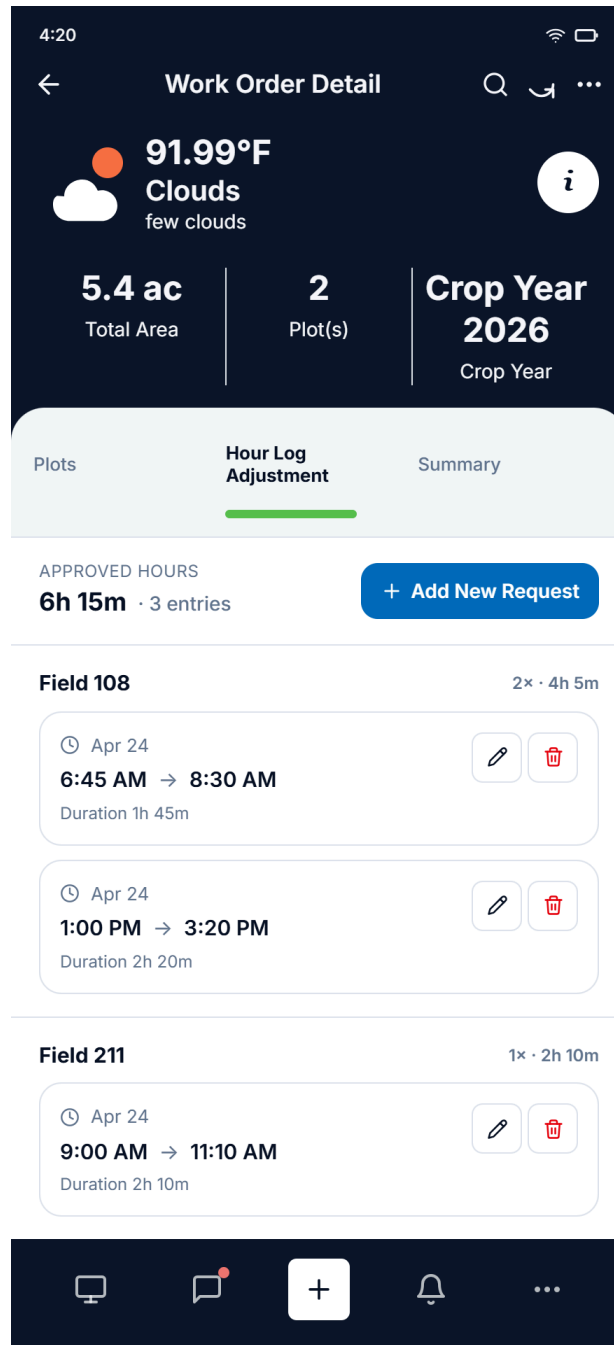

Figure 1: Mobile – Hour Log Adjustment Tab

The tab shows the approved hours and the number of entries at the top, then the entries grouped by field with the count and total per field. Each entry shows only the date, the start and end time and the duration, with an edit and a delete action — the field user does not need the asset detail on this list. Add New Request submits an entry the app never recorded.

Figure 2: Mobile – Add New Request

The operator selects the field, enters the job start and job end date and time, selects the machines and the implements from the multi-select dropdowns and searchable dropdown, and enters the reason. Only the fields on that work order are available. Each dropdown states its

selection — “N selected” when more than one asset is picked. The duration is calculated by the system and shown as a read-only value, and the sheet states that the request goes to the manager for approval.

Reject this change

The app's 5h 36m stays as the spent hours.

Yard time is not productive time on this work order.

Confirm reject
Cancel

Figure 10: Web – Reject the Change

Reject keeps the hours the app logged and records a reason that is shown to the operator. For a request that has no original entry, no entry is added at all.

Create Adjustment

The Selected Time Overlaps With Existing Job Time For The Same Resource And Machine

Existing Overlapping Entries

Work Order	Plot	Machine	Time
WO-533	108	John Deere 8R 410 (AST-0121)	04/24/2026 06:45 AM - 08:30 AM

If You Continue The System Will Redistribute Hours For All Impacted Overlapping Entries. Do You Want To Continue?

Cancel Continue

Figure 11: Web – Create Adjustment (Overlap Redistribution)

When the manager approves or adjusts a request whose time overlaps another entry of the same resource, the system lists the overlapping entries with their work order, plot, machines and time. On Continue the hours of all impacted entries are redistributed. This prompt appears on the web app only.

Mobile Hour Log Update After Approval

When the manager approves or adjusts an hour adjustment request, the resource's Hour Log should be updated with the approved/adjusted hours and reflected on the mobile app.

Audit Log on Approve and Reject

When an operator raises an Hour Log Change Request, the manager should receive a notification with the Work Order, Field, Resource, requested hours, and reason. An audit log should be created for every decision, including rejected requests, with the rejection reason recorded.

Important Point – Nothing Is Applied Without Approval

Hours submitted from the mobile app are never written into the work order directly. The entry stays exactly as the app recorded it until the manager approves or adjusts the request. This keeps the spent hours defensible at all times.

Important Point – Offline Support for Mobile App

The Farm Mobile App should allow an hour log change request to be prepared and saved without an internet connection, and sync it once the connection is restored. The mandatory-field and job-end-after-job-start validations apply before the request can be saved offline, and decisions made while the device was offline are applied to the mobile hour log at the next sync.

Important Point – Feature-Based Access

Hour Log Change Request functionality should be controlled through the **Feature Set**. The feature can be enabled or disabled as required, and the related actions, including Add New Request, Edit, Approve, Adjust, and Reject, should only be available when the feature is enabled.

Hour Log Request Number Format

The system should auto-generate a unique request number in a running sequence, for example REQ-0007, REQ-0008, REQ-0009.

Work Order Completion Validation

Before completing the Work Order, the system should validate whether any Hour Log Adjustment Requests are still pending. If a manager has not yet approved/rejected the request, the Work Order should not be completed.

Mobile Adjustment Request Availability

On the mobile app, an Hour Log Adjustment Request can only be added while the Work Order is in In Progress status. Once the Work Order moves to Review, no new adjustment request can be raised.

Hour Log Adjustment Tab Visibility

The Hour Log Adjustment tab should not be visible on the mobile app for Supervisor, Admin, and Manager roles.

Integrations:

Integration with ERP

The approved spent hours per resource are posted to D365 / F&O for labour costing against the work order, the task and the field.

App User

App Access	Roles	Description
Farm Web App	Admin/Manager	The Farm Manager (back office user) on the AgriERP Web App can perform the below functions for hour log adjustment • Review the hour log change requests raised against a work order • Approve the requested hours • Adjust the hours, the machines, the implements and add a note for the operator • Resolve overlapping hours through the Create Adjustment prompt • Reject a request with a reason • Review the audit log of every decision • Review the spent hours per resource before posting for costing
Field staff	Machine operator	The Field Workers (Machine Operators) can raise hour log change requests for their own hours from the AgriERP Mobile App on tablets or mobile phones (permission-based). They cannot approve their own requests.

Persona | Farm Manager – Web App

Name: David Luke Role: Farm Manager Platform: Farm App Web

Farm Manager – Operational Responsibilities

- Review the hour log change requests raised by the field on each work order.

- Compare the hours the app logged with the hours the operator is asking for.
- Approve, adjust or reject each request, with a note back to the operator where needed.
- Confirm the machines and implement the hours are recorded against.
- Resolve overlapping hours when a decision intersects an existing entry.
- Confirm the spent hours per resource before they are posted for labour costing.

Challenges

- Hour corrections arrive verbally or on paper, long after the work is done.
- Without the original hours and a reason side by side, the manager cannot judge whether a change is genuine.
- Editing hours directly leaves no record of who asked for the change or why.
- A correction can accidentally overlap or overwrite hours already recorded for the same machine.

Farm Manager – Business Goals

- Keep the spent hours on every work order accurate and defensible.
- Decide every hour change in one place with the original hours, the request and the reason in view.
- Keep a full audit trail of who raised each change, who decided it and what was decided.
- Post only approved hours to ERP for labour costing.

Persona | Machine Operator – Mobile App

Name: John Role: Machine Operator -Platform: Farm App Mobile

Machine Operator – Operational Responsibilities

- Run the assigned work order and let the app record the job hours.
- Check the approved hours on the Hour Log Adjustment tab.
- Raise a new entry for a run the app never recorded.
- Raise a change on an entry the app recorded wrongly, with a short reason.
- Select every machine and implement the run was actually made with.
- Check the updated hours once the manager has decided.

Challenges

- The app logs him in late or exits the job by itself, so the recorded hours are short.
- A whole run can be missing because the app was closed.
- A run made with two machines or with an implement behind the machine could not be recorded correctly.
- Telling the manager verbally means the correction is forgotten or entered wrongly.
- He cannot see whether a correction he asked for was accepted.

Machine Operator – Business Goals

- Get credit for the hours actually worked, against the right machines and implements.
- Raise a correction at the moment he notices it, from the same work order he is running.
- See the decided hours and the manager's note on his own app without having to ask.

Farm Manager User Journey

User: David Luke Role: Farm Manager Platform: Farm App Web

Hour Log Adjustment End to End Web Flow

- David logs in to the Farm App Web with his credentials.
- He opens the work order from the Work Orders module.
- On the Resources table he sees the Hour Log Changes column and the “to review” chip against the resources that have requests waiting.
- He clicks the chip on a resource to open the Hour Log Change Requests drawer for that resource.
- For each request David compares the hours logged by the app, the hours requested and the resulting change in spent hours, and reads the machines, the implements and the operator's reason.
- David decides the request.
 - Approve — the requested hours are accepted as they are.
 - Adjust — David sets his own job start and job end, corrects the machines and implements in the dropdowns, and adds a note for the operator.
 - Reject — the app's hours stay and David records the reason.
- If the decided hours overlap another entry of the same resource sharing a machine, the system shows the Create Adjustment prompt and redistributes the impacted hours on Continue.
- The decided hours are written into that resource's hour log, the Spent Hours on the Resources table update immediately, and the hour log on the operator's mobile app is updated with the same hours.
- An audit log entry is created for the decision with the reason, and is available against the work order.
- David confirms the spent hours per resource and the hours are posted to D365 / F&O for labour costing.

Machine Operator User Journey

User: John Role: Machine Operator Platform: Farm App Mobile

Hour Log Adjustment End to End Mob Flow:

- John logs in to the Farm App Mobile with his credentials.

- He starts his assigned work order and the app records the job start and end time itself.
- John opens the work order and the Hour Log Adjustment tab and checks the approved hours per field — each entry shows the date, the times and the duration.
- If an entry is wrong, John taps the edit action on that entry to open Request Hour Change.
- If a run was never recorded, John taps Add New Request instead.
- John selects the field and enters the job start and job end date and time.
- If the job end is not later than the job start, the app states it and John corrects the time before the request can be sent.
- John opens the Machine dropdown and ticks every machine the run was made with, then the Implement dropdown for the implements behind them.
- The system calculates the duration and shows it as a read-only value.
- John enters the reason and sends the request; the entry stays unchanged until the manager decides it.
- John is not asked about overlapping hours — the manager resolves that on the web app.
- Once the manager decides, John's hour log is updated with the decided hours and he sees the decision and the manager's note on the mobile app.

Validation Rules

- **Mandatory Fields Validation**

The system should not allow the request to be sent unless all mandatory fields are filled.

Mandatory fields include Field, Job start date, Job start time, Job end date, Job end time, at least one Machine and Reason. Implement is optional.

Validation Messages:

“Select a field.” / “Enter the start date and time.” / “Enter the end date and time.” / “Select at least one machine.”

- **Job End After Job Start Validation**

The job end must be later than the job start. The mobile app must state this under the job end as soon as the two times are inconsistent, and must also block the submission with the same message. An end time that is the same as or earlier than the start time can never be saved.

Validation Message:

“The job end must be after the job start.”

The same rule applies to the manager’s adjusted hours on the web app.

- **Reason Mandatory Validation**

A reason is mandatory on every request, because the manager needs it to judge the change. The request cannot be sent without it.

Validation Message:

“Add a short reason — your manager needs it to approve.”

- **Field Restricted to the Work Order**

The Field dropdown must only list the fields that belong to that work order, so hours can never be logged against a field the work order does not cover.

- **Overnight Job Validation**

If a resource works overnight, the system should split the hour log at midnight. One entry will be created up to 11:59 PM, and a second entry will start from 12:00 AM, resulting in two separate entries. .

- **Duration Non-Editable Field**

The duration is calculated by the system from the job start and the job end and is displayed as a read-only value on both the mobile app and the web app. The user cannot type or override it.

- **Overlap and Redistribution Validation — Web Only**

The overlap check runs when the manager approves or adjusts a request on the web app. The system compares the decided time against the existing entries of the same resource that share a machine with the decision. If the time ranges intersect, the decision must be stopped and the

Create Adjustment prompt shown with the overlapping entries listed, including their work order, plot, machines and time.

Prompt text:

“The Selected Time Overlaps With Existing Job Time For The Same Resource And Machine ... If You Continue The System Will Redistribute Hours For All Impacted Overlapping Entries. Do You Want To Continue?”

On Cancel nothing is decided. On Continue the hours of all impacted overlapping entries are redistributed so the same time is never counted twice.

This prompt must not appear on the mobile app. The operator submits a valid request and the overlap is resolved by the manager at the point of decision.

- **Per Resource Application Validation**

A decision must be applied to the hour log of the resource that raised the request only. It must not create, change or delete an entry belonging to any other resource.

- **Self Approval Restriction**

A user cannot approve, adjust or reject his own hour log change request. Deciding a request is a separate permission from raising one.

Business Cases:

- Every hour correction becomes a request with a reason, so the business always knows why the hours on a work order differ from what the app recorded.
- The manager decides every change, so the spent hours posted for labour costing are always either the app's own hours or hours a manager has approved.
- The decided hours flow back to the mobile app, so the operator and the manager are always looking at the same approved hours and there is no second conversation about what was credited.
- Every approve, adjust and reject writes an audit log entry with the reason, so a labour cost can be defended months later without relying on anyone's memory.
- Runs the app never recorded can still be captured, so labour that was genuinely worked is not lost from the cost of the field.
- Recording every machine and implement used on a run lets the business attribute the hours to the right assets, which supports machine utilisation and maintenance planning as well as labour costing.
- Keeping the machine and implement selection inside a dropdown keeps the field form short while still allowing several assets on one run.
- The mobile hour list shows only the times and the duration, so a field user can check his hours at a glance on a phone.

- Wrong entries can be corrected from the field at the moment the operator notices them, instead of being reported verbally days later.
- The job-end-after-job-start rule stops impossible time ranges from ever reaching the manager, so review time is spent on genuine judgement rather than obvious data errors.
- Keeping the overlap redistribution on the web app means the operator is never asked to make a decision about other entries — the field user submits, the manager resolves.
- Adjust lets the manager accept part of a request — for example approving from the time the machine reached the block but not the yard time — instead of having to reject the whole change.
- Reject with a reason gives the operator an answer, which reduces repeated requests for the same hours.
- Applying a decision to one resource only prevents a correction for one operator from silently changing another operator's hours on the same work order.
- The overlap prompt prevents the same time being counted twice for the same machine, which protects both the labour cost and the machine utilisation figures.
- Spent hours on the Resources table update as soon as a decision is made, so the manager sees the effect of the decision immediately.
- Offline capture allows the request to be raised in fields with no connectivity and synced later without losing the reason, the times or the asset selection.

Data Dictionary

Field Name	Description	Source	Data Type
Request No.	Auto-generated running number of the hour log change request.	System Generated	String
Work Order	The work order the hours belong to.	System / Farm Mobile App	String
Resource	The resource whose hours the request belongs to. A decision is applied to this resource only.	Farm Mobile App	String
Resource Group	The resource group of the resource, for example Machine Operator.	System	String
Field / Plot	The field the hours are logged against. Restricted to the fields on that work order.	Farm Mobile App	String
Machines	The machines the hours are logged against. Multi-select dropdown, at least one required. Changeable by the manager when adjusting.	Farm Mobile App / Farm Web App	List of String

Implements	The implements run behind the machines. Multi-select dropdown and optional. Changeable by the manager when adjusting.	Farm Mobile App / Farm Web App	List of String
Entry Reference	The existing hour log entry the request is changing. Empty when the request is a new entry the app never recorded.	System Generated	String
Job Start (original)	The job start time the mobile app recorded itself.	System Generated	DateTime
Job End (original)	The job end time the mobile app recorded itself.	System Generated	DateTime
Job Start (requested)	The job start date and time the operator is asking for.	Farm Mobile App	DateTime
Job End (requested)	The job end date and time the operator is asking for. Must be later than the requested start.	Farm Mobile App	DateTime
Duration	Calculated from the job start and job end. Read-only on both apps.	System Generated	Decimal
Change in Spent Hours	The difference between the requested duration and the original duration, shown to the manager.	System Generated	Decimal
Reason	The operator's reason for the change. Mandatory on every request.	Farm Mobile App	String
Device	The device the request was raised from, for example iOS or Android.	System Generated	String
Raised By	The user who raised the request.	System Generated	String
Raised At	The date and time the request was raised.	System Generated	DateTime
Status	Needs review, Approved, Adjusted or Rejected.	System Generated	Enum
Job Start (final)	The job start time the manager decided. Equals the requested start on approve, the manager's start on adjust, and the original start on reject.	System Generated	DateTime
Job End (final)	The job end time the manager decided.	System Generated	DateTime
Overlapping Entries	The existing entries of the same resource sharing a machine whose time intersects the decided time. Listed in the	System Generated	List

	Create Adjustment prompt on the web app.		
Redistribution Applied	Whether the Create Adjustment redistribution was confirmed for the decision. Recorded in the audit log.	System Generated	Boolean
Manager Note	The note the manager sends back to the operator on adjust. Recorded in the audit log.	Farm Web App	String
Rejection Reason	The reason the manager rejected the request. Mandatory on reject and recorded in the audit log.	Farm Web App	String
Decided By	The manager who decided the request.	System Generated	String
Decided At	The date and time the request was decided.	System Generated	DateTime
Audit Log Entry	The immutable record written on every approve, adjust and reject, holding the original, requested and decided hours, the assets, the reasons and the decision metadata.	System Generated	Record
Spent Hours	The approved hours per resource on the work order, updated as soon as a decision is made and reflected on the mobile hour log.	System Generated	Decimal
