1.1 Purpose

The purpose of this document is to provide an end-to-end process flow and requirement for the Harvesting functionality from the Farm App (Web) and ERP. This document should be used as guidance during detailed design, build, and other project-related activities. This document aims to provide a solution baseline. This document is intended to define and lock the baseline solution approach from the process flow perspective.

1.2 Scope

This document is the primary part of the Farm Web & Mobile App design. This document should be read in conjunction with the DevOps requirements to provide the full understanding of the entire harvesting solution designed for ERP integration.

1.3 Audience

The primary audiences for this document are Folio3 project executives, management, and wider implementation teams.

1.4 Functional Assumptions

These workflows will be used as a primary design artifact to confirm existing (delivered)

Executive Summary

This Document is created to fill up the gap between teams in the understanding of the Harvest flow, its functionality, and the stages the data goes through during the entire Farm App processing.

Introduction

Problem Statement

The agriculture industry faces significant challenges in efficiently managing harvest operations due to fragmented processes, manual record-keeping, and lack of real-time data integration. Growers and farm

managers often rely on spreadsheets or paper-based systems to track harvest activities, leading to inaccuracies in yield data, resource allocation, and timing.

These inefficiencies result in:

- Lost productivity
- Delayed decision-making
- Increased operational costs.
- The absence of digital traceability and standardized workflows makes it difficult to monitor labor, machinery, and field performance across multiple sites.

Without an integrated harvest management solution, agricultural enterprises struggle to optimize harvest logistics, ensure compliance, and make data-driven decisions that improve profitability and sustainability.

Solution Overview

The proposed Harvest Management Solution in AgriERP provides an integrated process to plan, create, manage, and post Harvest Tickets through the Web and Mobile Apps, with synchronization to YHS Receiving WMS and ERP.

On the Web App, the Farm Operations Manager can plan harvest tickets against a Field and Variety, create multiple planned loads, and optionally enter load details in advance. On the Mobile App, Supervisors and authorized field users can open the planned tickets and capture the actual load details when the truck arrives. Mobile also supports offline ticket creation and synchronization once connectivity is restored.

Fleet-related information such as driver, truck, trailer, and license plates will come from YHS Fleet Management, while Variety information will come from GP. Grower, Site, Huller Site, and Season will be defaulted based on the configured context.

Load Type will be determined based on the Field and Variety combination, including First Load, In Progress, Split Load, and Last Load. If a Last Load already exists, the system will prompt the user before allowing another Last Load.

Submitted Harvest Ticket data and attachments will sync with YHS Receiving WMS, and weight certificates or actual quantity received from YHS will sync back to AgriERP. Harvest Tickets will be linked to the relevant ERP project for posting, and posting will be restricted if the required project linkage is missing. Once the ticket is completed in YHS and successfully posted to ERP, a posted status will be displayed in AgriERP.
In R2, Harvest Central will support license plate scanning to capture the required truck and trailer plate details automatically during Harvest Ticket creation, reducing manual entry and improving data accuracy.

Summary

The Harvest Management Solution digitizes Harvest Ticket creation and management across the AgriERP Web and Mobile Apps. Loads are planned on the web app from the Harvest Central tab or the Harvest Ticket Detail screen, and captured on site from the mobile app with offline and permission-based support.

The solution captures harvest load details, syncs ticket data and attachments with AgriWMS, links tickets with the relevant project, and supports controlled posting to ERP.

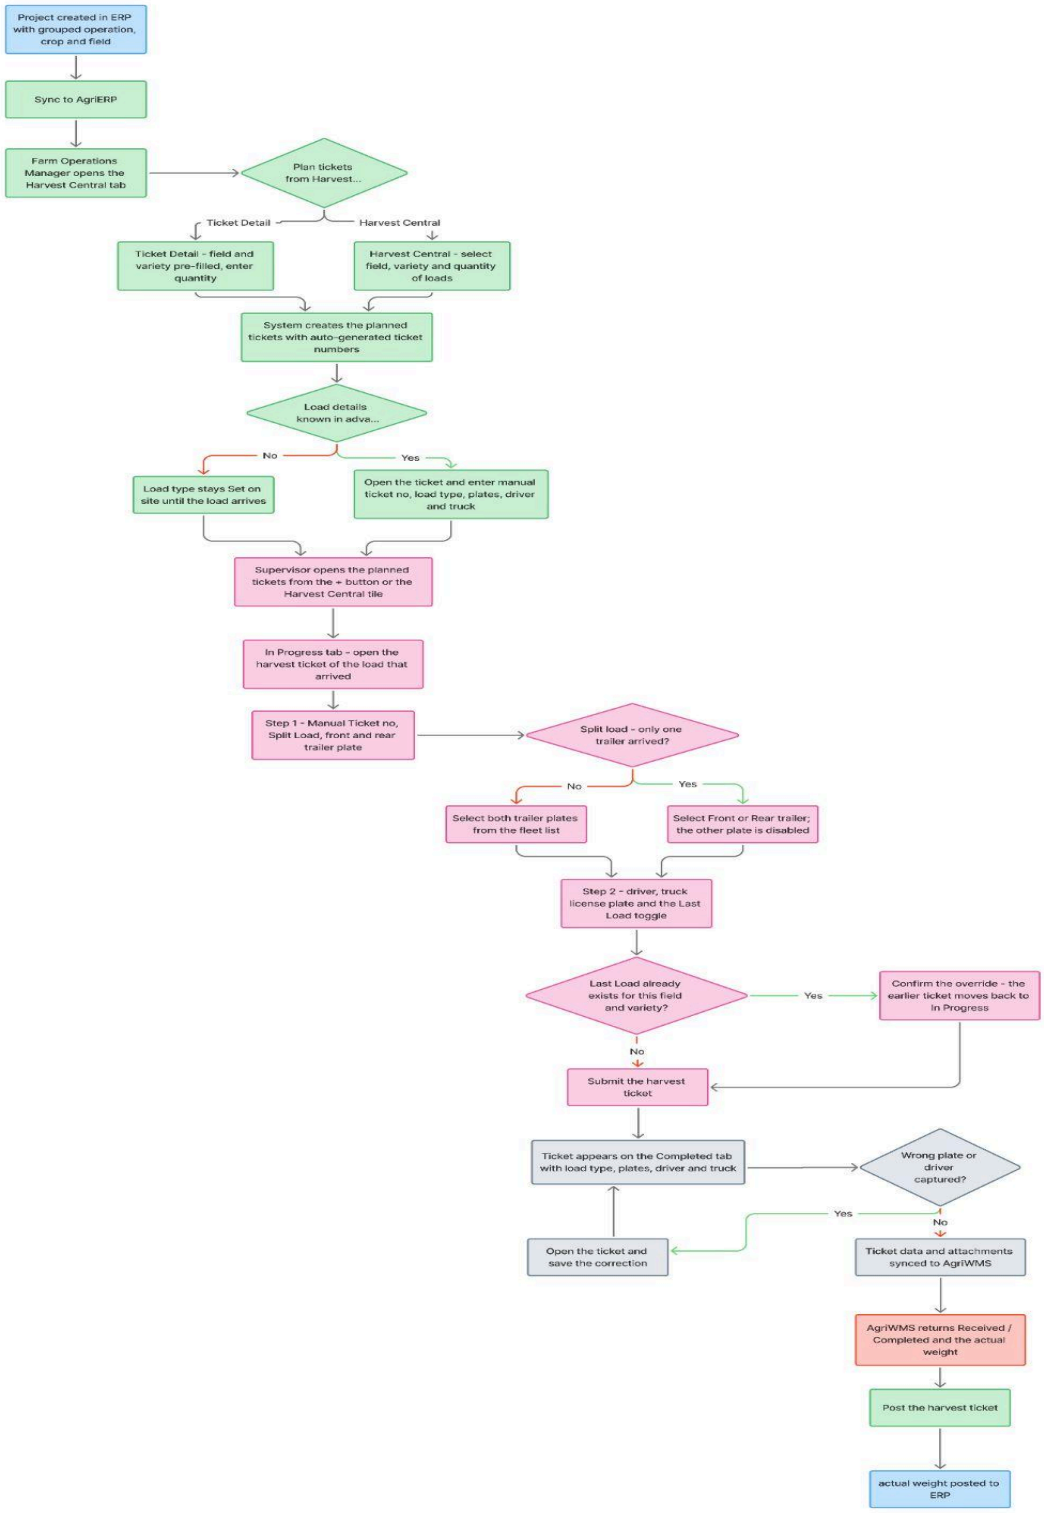

The document is intended for use by development, QA, functional, and design teams to ensure cohesive and effective feature implementation.

Harvest Work Order Management

Harvest work orders will follow the Ad-hoc Work Order process.(F&O document link required) These work orders are created directly in the AgriERP Web App by authorized field staff or Farm Operations Managers for harvesting activities.

Since these tasks are ad-hoc, they will not originate from D365 F&SCM as planned tasks. Once the harvest work order is created in the Farm App, the corresponding ad-hoc task will be added to the WBS Task Lines for the assigned job in D365 F&SCM.These harvest ad-hoc tasks will not have any budgeted or estimated cost, time, or date, because they are created as unplanned harvesting activities.

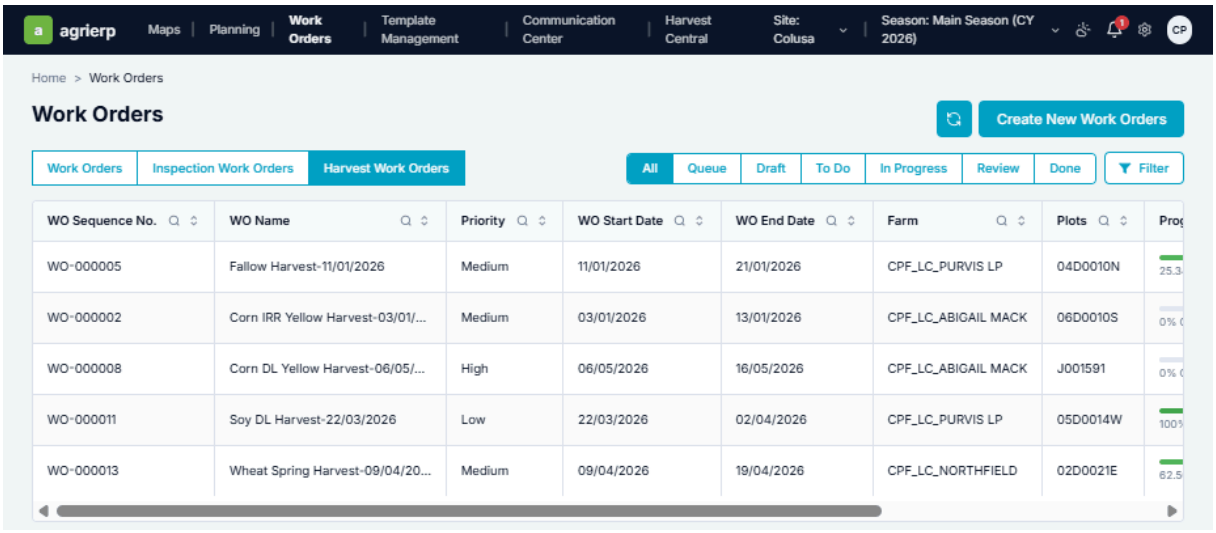

Workflow

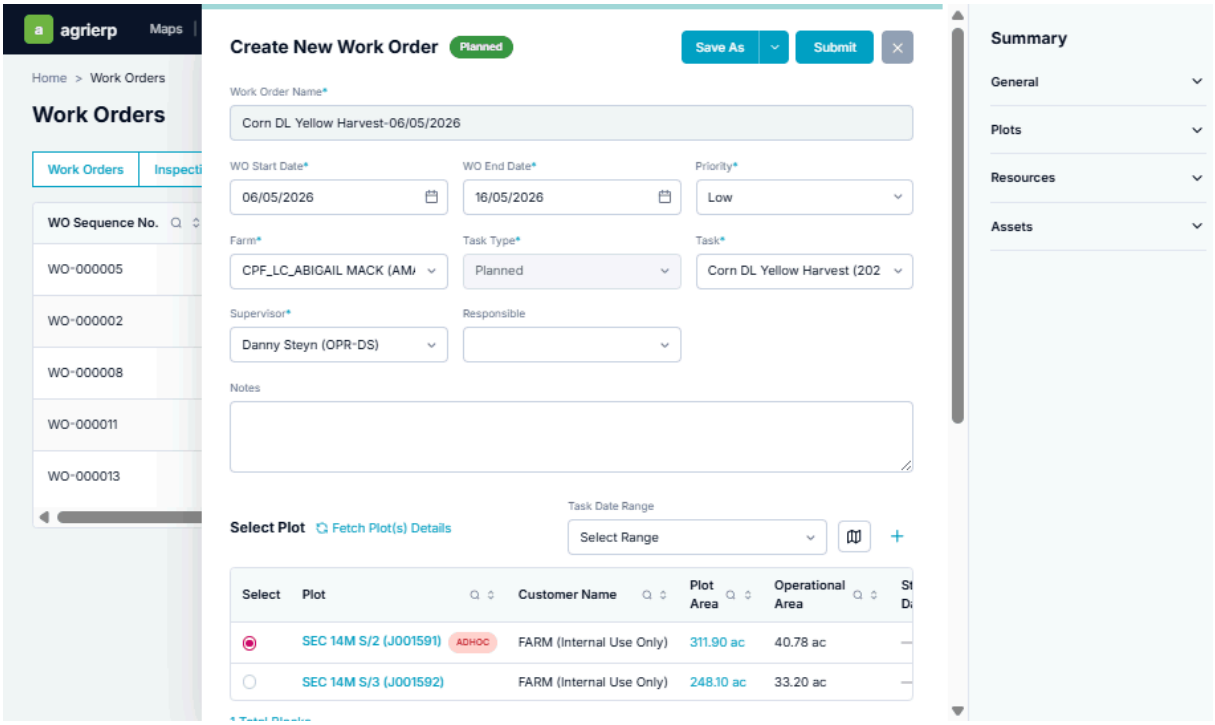

Project created in ERP with grouped operation, crop and field
Sync to AgriERP

AgriERP Web App (Harvest Ticket) – Farm Operations Manager

The web interface is used by Farm Operations Managers to plan harvest tickets, review them and adjust their details before posting.

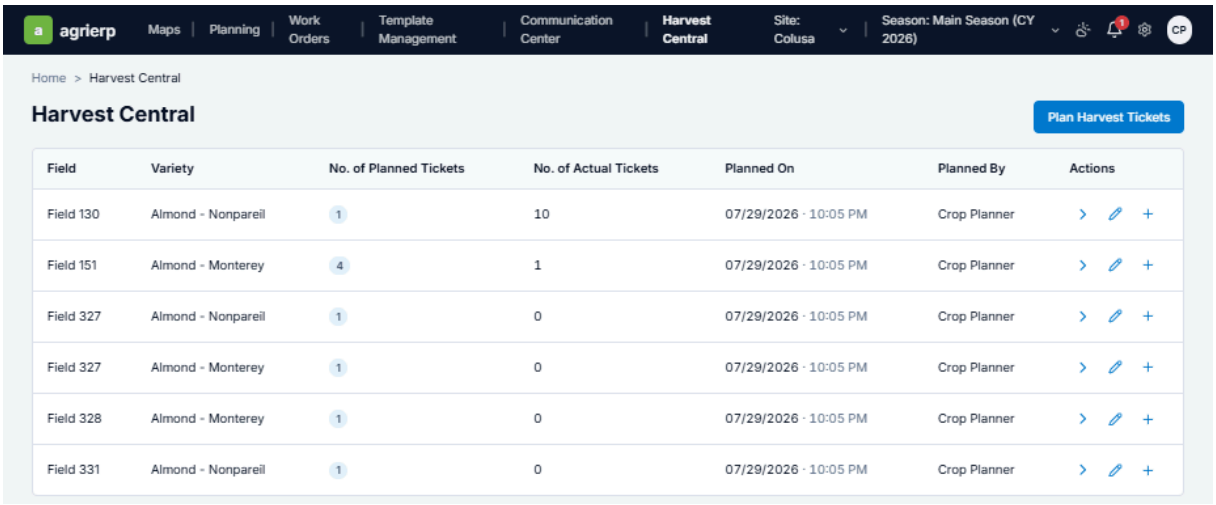

Figure 1: Harvest Ticket Tab

This tab shows the list of fields, their varieties, the number of planned and actual harvest tickets for each field, and when the plan was created. The user can open any row to view details or click Plan Harvest Tickets to plan new tickets.

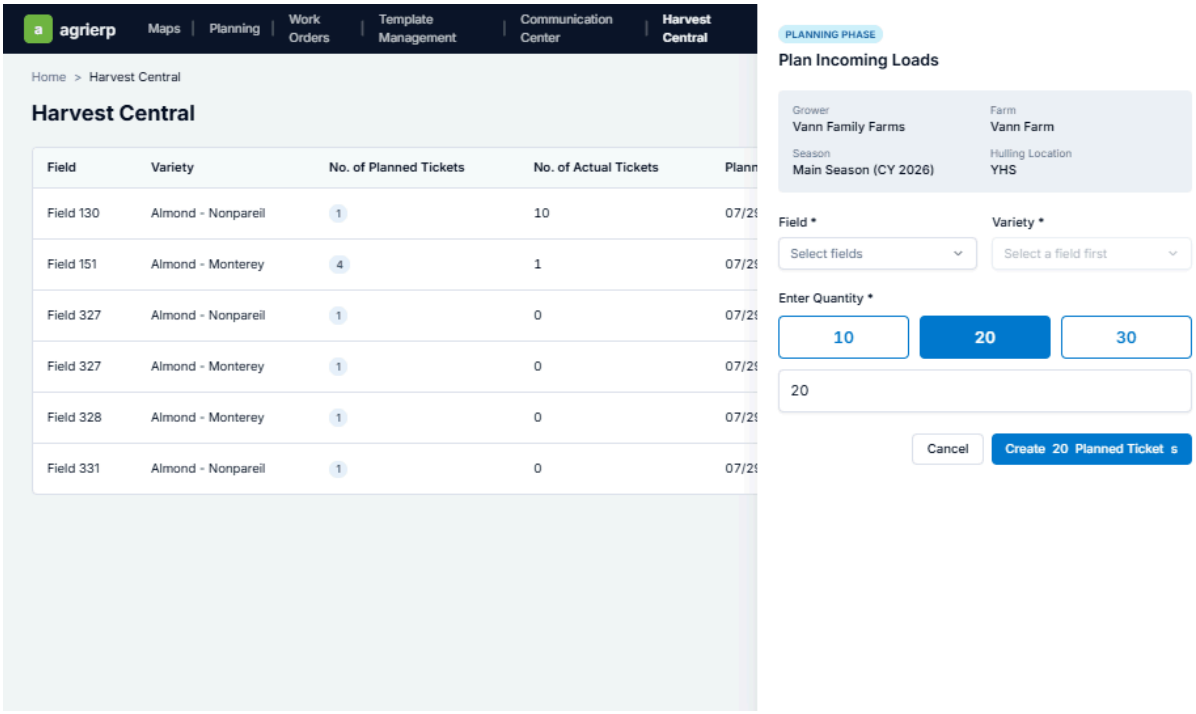

Figure 2: Plan Harvest Tickets – From Harvest Central

When the user plans tickets from Harvest Central, all fields are blank. The user selects the field and variety and the quantity of loads expected; the system then creates that many planned tickets with system-generated ticket numbers.

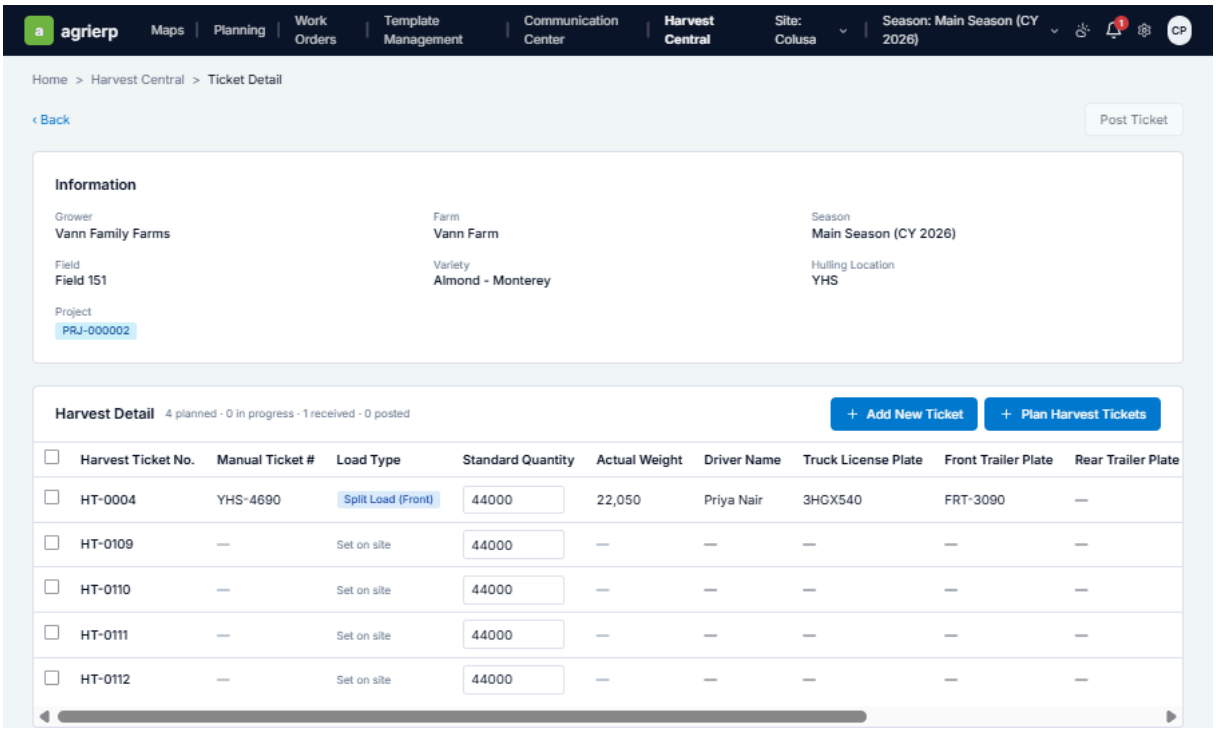

Figure 3: Harvest Ticket Detail Page

This page shows basic information like Grower, Farm, Season, Field, Hulling location and Variety. It also shows a table of all harvest tickets created for that field and variety with the manual ticket number, load type, standard quantity, actual weight, driver, truck and trailer plates. Edit and delete are available per ticket, and from this screen the user posts the ticket and links it to the project.

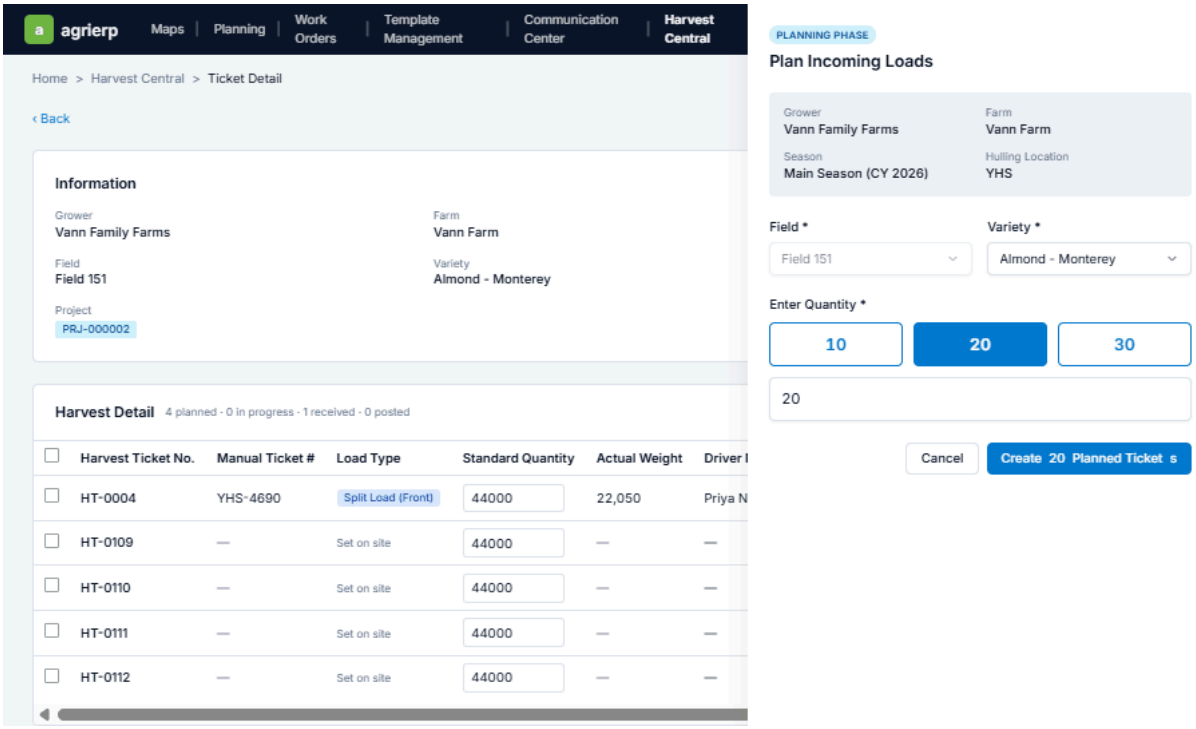

Figure 4: Plan Harvest Tickets – From Detail Page

When the user plans tickets from the detail page, the Field and Variety are already filled in and cannot be changed.

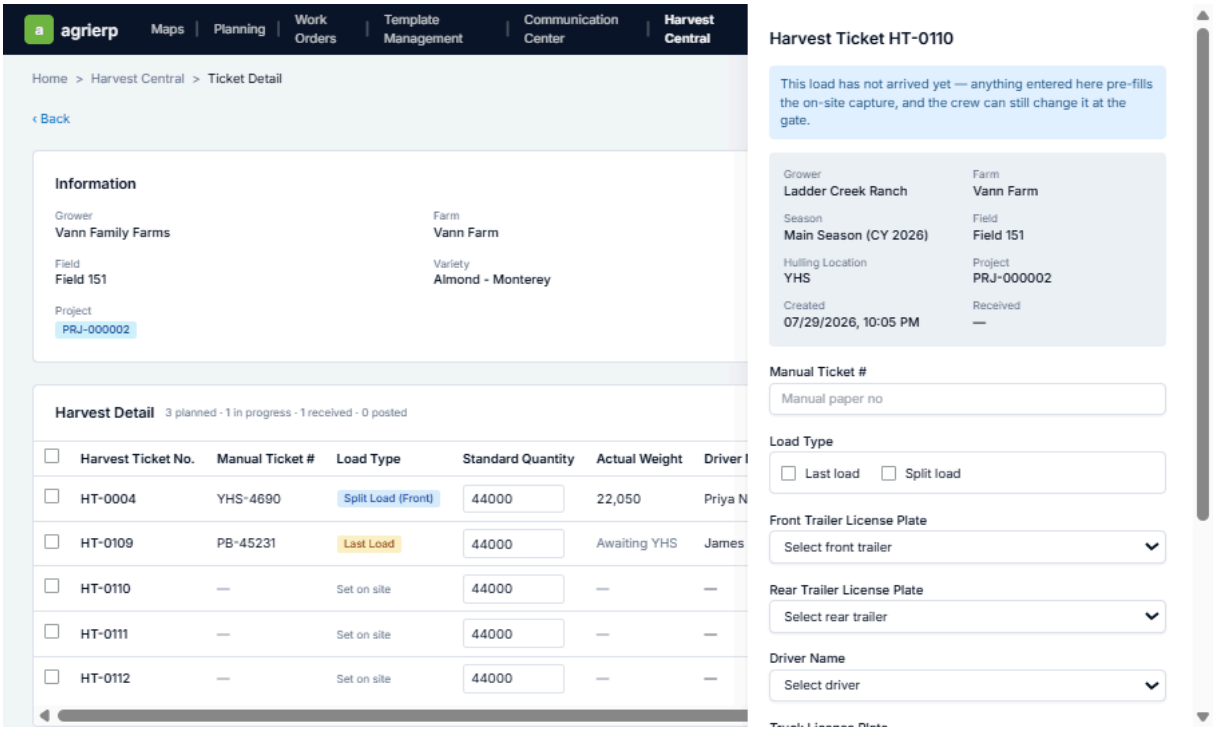

Figure 5: Harvest Ticket View / Edit Drawer

This drawer is used to enter or edit the details of a harvest ticket. It shows ticket details at the top and allows the user to update the manual ticket number, load type, trailer plates, driver name, truck plate, standard quantity and attachments. All plates and the driver are selected from a dropdown. For a ticket that has not arrived yet, the drawer notes that anything entered here pre-fills the on-site capture. The system-generated Harvest Ticket number is shown as the drawer title and cannot be changed.

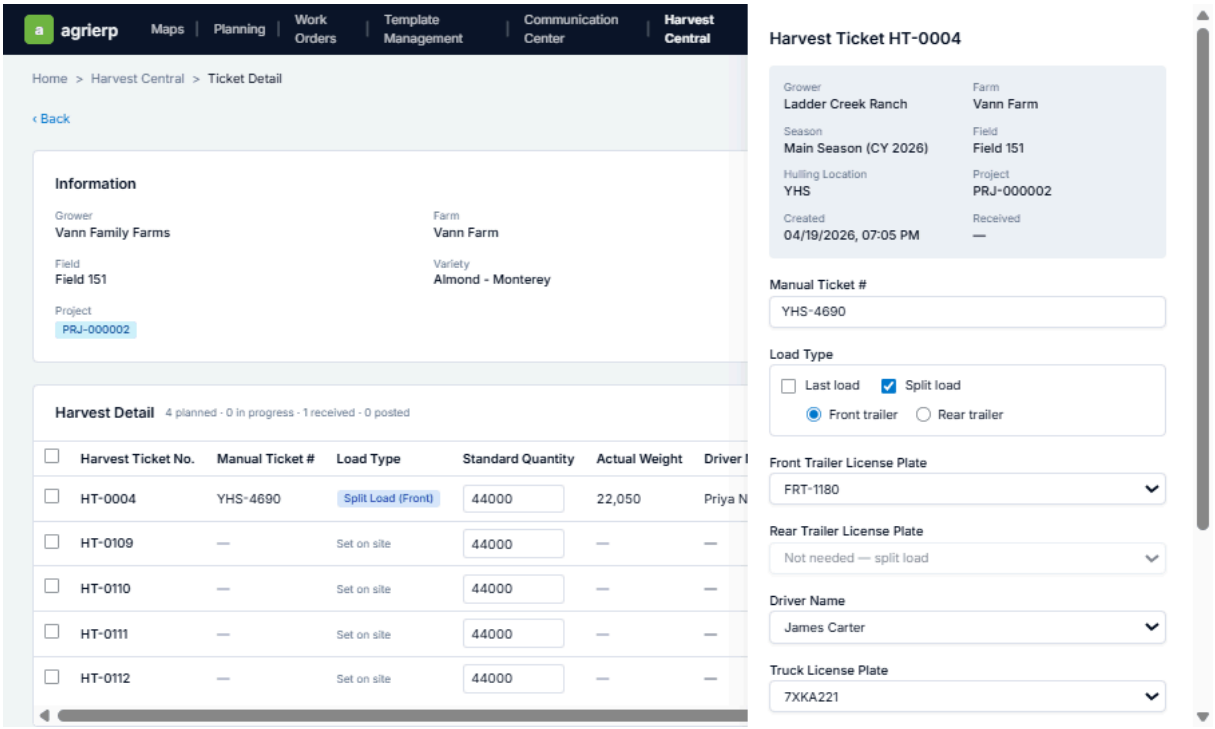

Figure 6: Split Load Behavior

When the user selects Split load, two more options appear: Front trailer and Rear trailer. The user must select one option, and the trailer plate that did not arrive is disabled.

Harvest Ticket (Mobile App) – Supervisor

The mobile interface is used by Supervisors and Machine Operators in the field. It provides quick access to the planned harvest tickets directly from the dashboard via an action button ("+") that opens a bottom sheet, and from the Harvest Central tile.

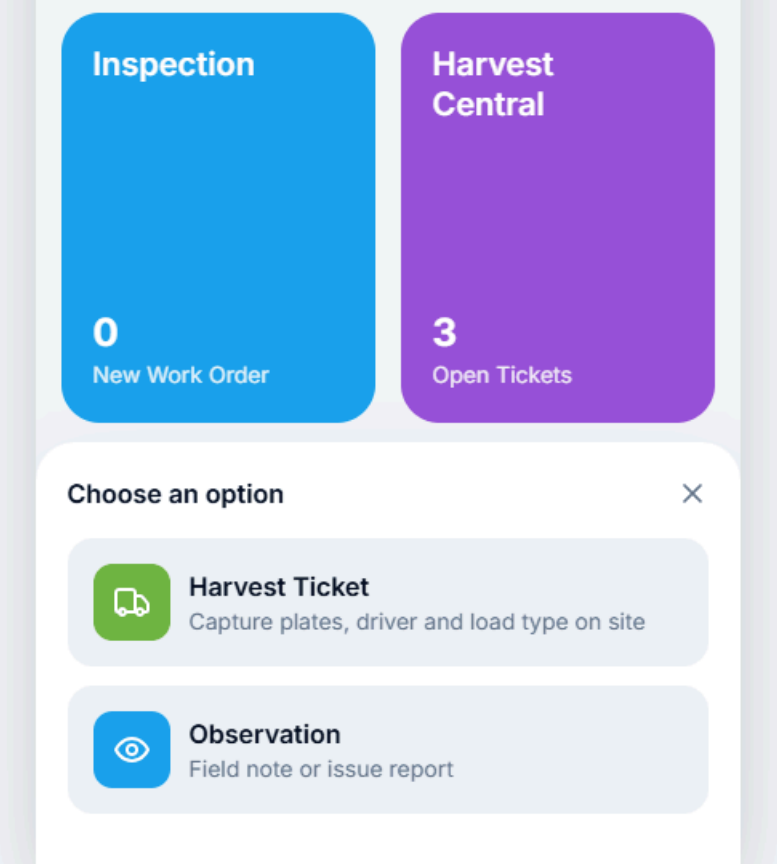

Figure 7: Mobile – "+" Button Options

When the user taps the + button on the mobile app, a bottom sheet opens with two options. The user taps Harvest Ticket to open the harvest tickets waiting to be captured on site.

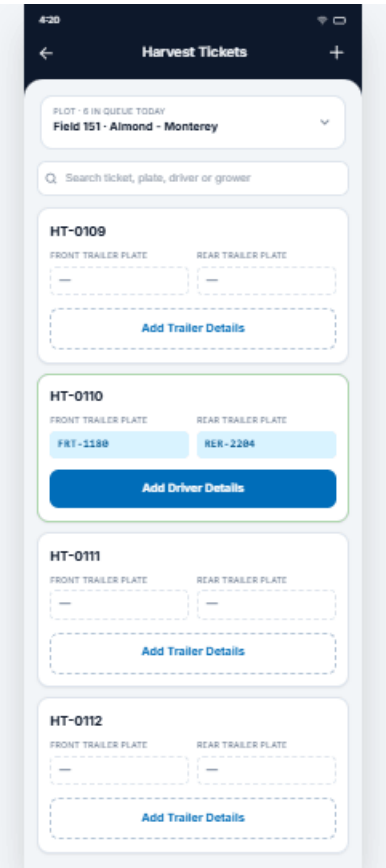

Figure 8: Mobile – Harvest Tickets Queue

The queue shows the harvest tickets planned for the selected field and variety. Each card shows the ticket number, the front and rear trailer plate entered so far and the single next action for that ticket — Add Trailer Details, Add Driver Details or Review & submit.

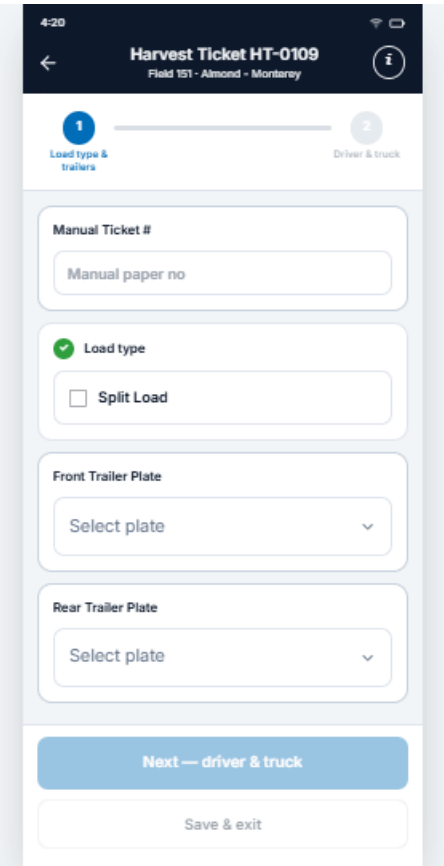

Figure 9: Mobile – Harvest Ticket Form (Step 1)

Step 1 captures the Manual Ticket # written on the physical paper ticket, the Split Load option, and both trailer plates. Each plate is selected from the fleet list through a searchable dropdown.

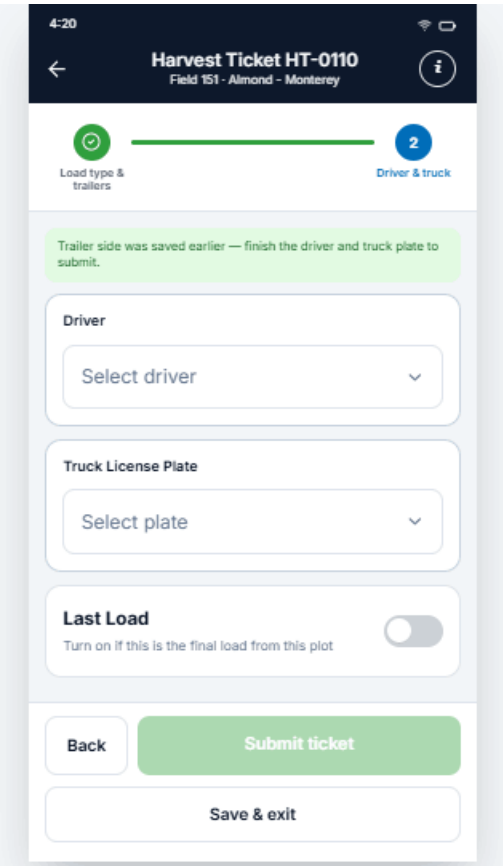

Figure 10: Mobile – Harvest Ticket Form (Step 2)

Step 2 captures the driver and the truck license plate from the same searchable dropdowns and carries the Last Load toggle, and then the user submits the harvest ticket. A partially filled ticket can be saved and finished later with Save & exit.

Central Harvest ticket on Mob

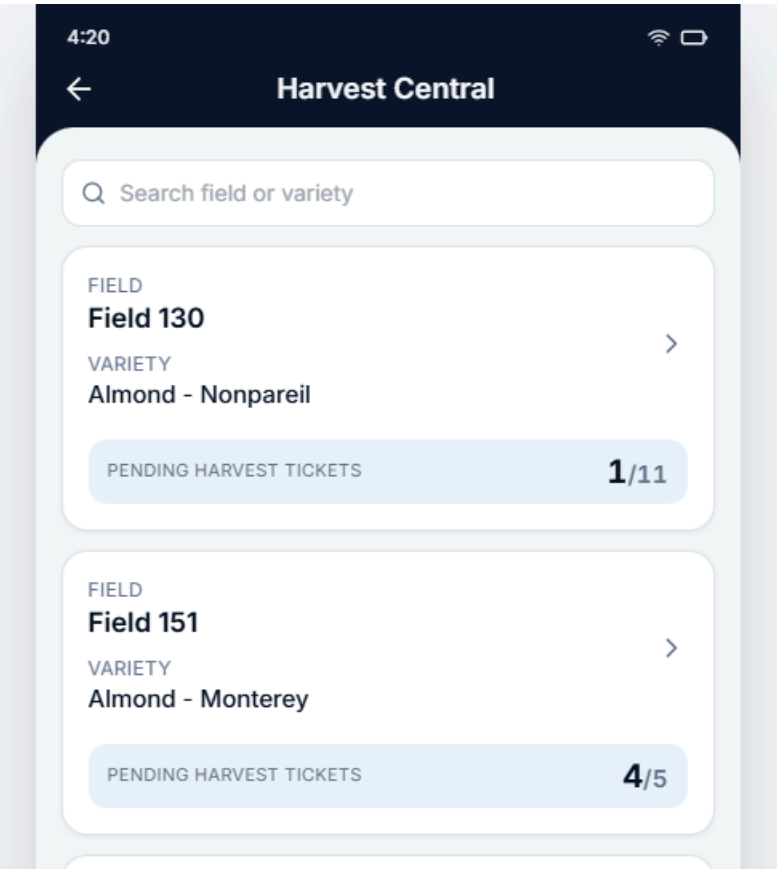

Figure 11: Harvest Central – Field & Variety List

Every field and variety block shows the pending harvest tickets against the total planned for that block, and the count updates as more tickets are planned or received.

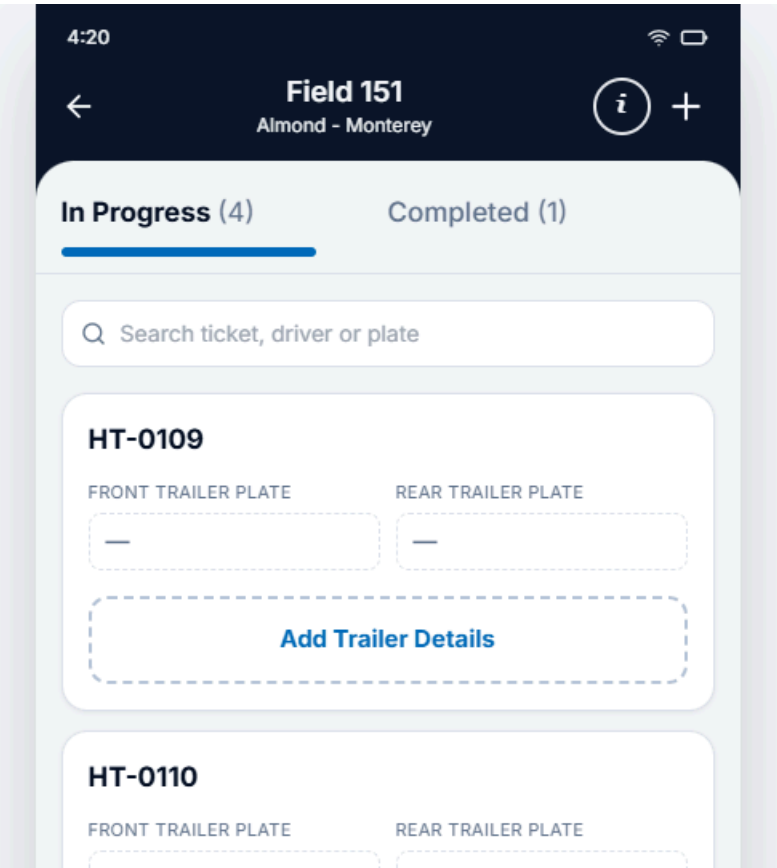

Figure 12: Harvest Central – In Progress

The In Progress tab lists the harvest tickets that still have to be captured for that field and variety, using the same cards as the queue.

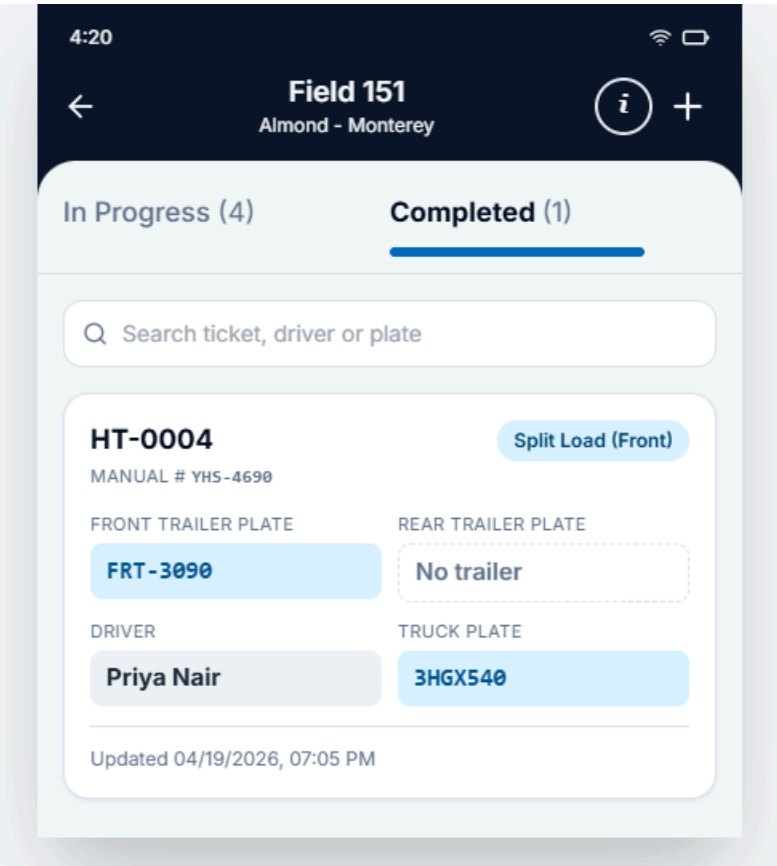

Figure 13: Harvest Central – Completed

The Completed tab shows the tickets that have been captured, with the load type, manual ticket number, both trailer plates, the driver and truck plate and the last updated date and time.

Important Point – Offline Support for Mobile App

The Farm Mobile App should provide full offline support for harvest ticket creation. The supervisor should be able to create and save harvest tickets even when there is no internet connection in the field. Once the internet connection is available again, the app should automatically sync the saved harvest tickets to the system/web app without data loss.

Important Point – Permission-Based Access

Harvest ticket creation should be permission-based. The Create New Harvest Ticket option should only be visible to users who have the required permission/access. Users without the required permission should not see this option on the mobile app and web app.

Harvest Ticket Audit Trail Logs

Harvest Ticket Audit Trail logs will be viewable inside notifications and view all logs screen.

Harvest Ticket Number Format

The system should auto-generate a unique Harvest Ticket Number based on Field Unique Number, random number , and Crop Year.

The random number should be generated separately for each Field and Crop Year combination to avoid duplicate Harvest Ticket Numbers.

Example format: HT-321-HB12-26

QR Code Generation for Harvest Ticket

When a Harvest Ticket is created, the system must automatically generate a unique QR code. The QR code must contain the relevant ticket information, including Truck, Driver, Truck License Plate, Trailer License Plate, Field, Variety, and date details.

The generated QR code must be displayed on the Harvest Central Detail screen for viewing and scanning. A Download option must be available on the Harvest Central Detail screen, allowing users to download and send the QR code via chat.

Field selection

The Field dropdown shall be filtered based on the selected Site, and once a Field is selected, its associated Farm shall be automatically populated in the header.

Manual Harvest ticket number

A Manual Harvest Ticket Number field must be available when creating a Harvest Ticket. The user will enter the ticket number shown on the physical paper Harvest Ticket. This field will not be mandatory. It is available in the web edit drawer and as the first field of the mobile capture form, and it is shown as its own column on the Harvest Ticket Detail table.

Harvest Ticket creation limit

The maximum limit for Harvest Ticket creation will be 100.

Integrations:

Integration with AgriWMS

Harvest Ticket data will be sent from the Farm App to AgriWMS once the ticket is submitted. The submitted data will include the required harvest ticket details such as grower, field, variety, load details, ticket information, and any attachments added from the Farm App will also be synced with AgriWMS.

If the Harvest Ticket is edited or deleted in the Farm App, the same update will also be sent to AgriWMS so both systems remain synchronized. AgriWMS will process the ticket and return the updated status, such as Received or Completed, to the Farm App. Any attachments added in AgriWMS, such as a weight certificate, will also be synced back and reflected in the Farm App.

The actual weight/quantity will be returned to the Farm App. It will be sent from AgriWMS to AgriERP.

Harvest Ticket Fleet Mapping

When creating a Harvest Ticket, once a Truck is selected, the system will automatically fetch the Fleet associated with that Truck from the backend.

When the Harvest Ticket is submitted, the associated Fleet information will be synced to YHS along with the Harvest Ticket details.

On the Harvest Ticket Web App, a new column named Fleet will be added after the Actual Weight column. This column will display the Fleet associated with the selected Truck for that Harvest Ticket.

Integration with ERP

In ERP, the project will be created first with the required grouped operation, crop, and field details. After the project is created, the Harvest Work Order will be created/available against that ERP project. The Harvest Ticket will be created separately from a standalone Harvest Ticket form, but it will be associated with the ERP project based on the selected field and linked with the project for reference and posting.

Once the Harvest Ticket is ready for posting, the user will open the central tickets and post the Harvest Ticket against the ERP project. During posting, ERP will post the actual wieght FC document required

Integration with Grower Portal:

GP will provide the required harvest-related reference data, including varieties. Grower and Field data will also be synchronized through the integration so that it can be used when creating Harvest Tickets in the AgriERP Farm App and Field Tickets in AgriWMS.

App User

App Access	Roles	Description
Farm Web App	Admin/Manager	The Farm Manager(back office user) AgriERP Web App can perform the below function during Harvesting • Create Harvest work orders against the harvest task and assign them to field workers • Can Review Harvest Work Order Progress, Mark post to F&O • Will End and Mark Complete Harvest Work Order. • Can Adjust Machine and Field Workers Hrs • Can Plan Harvest Tickets from Web • Can adjust Harvest ticket details
Farm Mobile App	Supervisors	The supervisor is a field worker who can assign multiple Harvest Work at a time he can do the following functions using the AgriERP mobile app. • Open Work order for other field staff workers • Can add new resources and machines to work order. • Can Capture Harvest Tickets • Can mark Work Order Progress of other field workers • Can End Work Order • Can fill harvest ticket details
Field staff	Machine operator	The Field Workers (Machine Operators/Farm hands) can start their daily assigned job using the AgriERP Mobile app on Tablets or Mobile Phones They can do the following functions below • Start their assigned Harvest Workorders • Capture Harvest Tickets(permission-based) • Mark daily progress on assigned jobs • Communicate with Field Staff and back office using the chat feature

Persona | Farm Operations Manager – Web App

Name: David Luke Role: Farm Operations Manager Platform: Farm App Web

Farm Operations Manager – Operational Responsibilities

- Create Harvest workorder

- Plan and manage harvest tickets from the central ticket modules on the web app.
- Open the Harvest Ticket tab, plan the expected loads, and enter load details, driver details and truck/trailer information in advance where they are known.
- Linked to the project.
- Make adjustments if required before posting to D365/F&O.

Challenges

- Difficulty reviewing harvest ticket details in one place when data is coming from multiple fields, drivers, trucks, and trailers.
- Manual review of ticket information can cause delays, missing details, or incorrect posting to D365/F&O.

Farm Operations Manager – Business Goals

- Manage harvest ticket planning and review from the web app in a structured and controlled process.
- Ensure all harvest ticket details are complete, accurate, and ready for posting.
- Improve visibility of harvest ticket status, submitted loads, and required adjustments before final posting to D365/F&O.

Persona | Supervisor – Mobile App

Name: John Role: Field Supervisor / Machine Operator Supervisor Platform: Farm App Mobile

Supervisor – Operational Responsibilities

- Consume Harvest work order.
- Open the planned harvest tickets from the mobile app using the “+” button or the Harvest Central tile.
- Select the harvest ticket for the field and variety being harvested and complete the capture form.
- Enter the manual ticket number, answer the load type, select the front trailer plate, rear trailer plate, driver name and truck license plate, and submit the harvest ticket.

Challenges

- Field supervisors need to capture harvest ticket data quickly while working in the field.
- Manual or delayed entry of truck, trailer, load, and attachment details can create errors in harvest records.
- It can be difficult to ensure harvest ticket data is submitted on time with complete field and load information.

Field Supervisor – Business Goals

- Capture and submit harvest tickets directly from the mobile app in real time.

- Ensure accurate capture of field, variety, load type, driver, truck and trailer details.
- Reduce manual paper-based tracking and improve timely submission of harvest ticket data for review and posting.

Farm Operations Manager User Journey

User: David Luke Role: Farm Operations Manager Platform: Farm App Web

Harvest End to End Web Flow

- David logs in to the Farm App Web with his credentials.
- Go to the work order management page and create a harvest work order
- He navigates to the Harvest Central tab.
- David plans the harvest tickets.
- From the Harvest Central tab
- From the Harvest ticket detail screen
- The system opens the Plan Incoming Loads panel with Grower, Farm, Season and Hulling Location defaulted and the remaining fields blank.
- David selects the field and variety and the number of loads expected, and the system creates that many planned tickets.
- David can open any planned ticket and enter the details that are already known — manual ticket number, load type, trailer plates, driver and truck.
- After the harvest ticket is captured on site
- David reviews the ticket details
- He can make adjustments if required
- David can delete the harvest tickets if required
- Once the ticket is reviewed, David selects the harvest ticket and linked to the project
- The harvest ticket is ready to be posted to D365/F&O.
- David clicks on the post ticket button.
- David can end the work order.

Field Supervisor User Journey

User: John Role: Field Supervisor / Machine Operator Supervisor Platform: Farm App Mobile

Harvest End to End Mob Flow:

- John logs in to the Farm App Mobile with his credentials.
- Select Open Harvest Work order Click Start Job Select his Machine and Start Harvesting for others.
- He opens the harvest tickets waiting for his field.

- From the Harvest Central tile
- From the “+” button from the bottom navigation bar.
- John selects the field and variety block and opens the In Progress tab.
- John taps the harvest ticket of the load that has arrived.
- John enters the manual ticket number shown on the paper ticket.
- If only one trailer arrived, John ticks Split Load and selects the Front trailer or the Rear trailer.
- John selects the front trailer plate and the rear trailer plate from the fleet list.
- John continues to step 2 and selects the driver and truck license plate.
- If this is the final load from the plot, John turns on the Last Load toggle.
- John submits the harvest ticket from the mobile app.
- If a wrong driver, truck or trailer plate was selected, John opens the ticket again from the Completed tab and saves the correction.
- Once submitted, the harvest ticket is created and available for review and posting
- Navigate to harvest work order and pause the job.

Validation Rules

- Mandatory Fields Validation

The system will validate the required information at the time of posting, not when the Harvest Ticket is saved; if any required posting data is missing, the ticket can be saved but posting will be restricted until the missing information is completed.

- Load Type Optional Validation

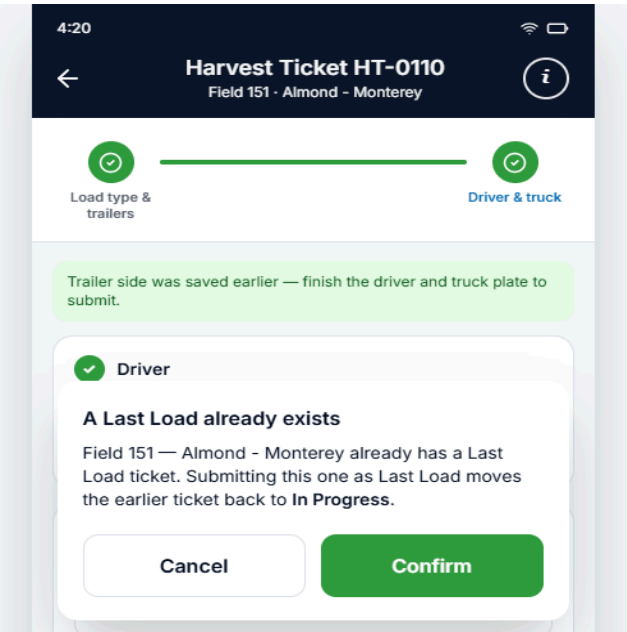

Load Type will not be a mandatory field for Harvest Ticket creation. If the user does not turn on the Last Load toggle or tick Split Load, the system will automatically determine the load type based on the selected Field and Variety.

- If no previous first load exists against that Field and Variety, the system will automatically set the Load Type as First Load on the web app.
- After the first harvest ticket is created, any next harvest ticket created against the same Field and Variety will show the Load Type as In Progress on the web app for Farm Operations Manager review.
- If the selected load is a Split(Front Load) and it is also the first load for that Field and Variety, then the web app should display the Load Type as: First Load - Split Front Load
- A planned ticket that has not been captured yet shows the Load Type as “Set on site” on the Harvest Ticket Detail table.
- Last Load Existing Validation

If a Last Load has already been created against the same Field and Variety, the system should show a confirmation prompt before allowing another Last Load to be created.

The prompt should inform the user that a Last Load already exists for the selected Field and Variety and ask whether they want to override it. On confirmation the earlier ticket moves back to In Progress.

Mob:

- Split Load Option Validation

When the user selects Split Load, the system should show two options: Front trailer and Rear trailer. These options should only appear for Split Load and should not appear for First Load, Last Load, or blank load type.

- Front Only / Back Only Selection Validation

For Split Load, the user can select only one option at a time. When one trailer is selected, the plate field of the other trailer is disabled and marked as not needed.

- Harvest Ticket Edit/Delete allowing Before Completion

The Harvest Ticket can be edited or deleted only before its completion status is marked in YHS. Any changes made to the Harvest Ticket before completion, including edits, corrections of a wrongly selected driver or plate, or voiding the ticket, must also be synchronized and updated in YHS.

Once the Harvest Ticket is marked as completed in YHS, it can no longer be edited or deleted.

- Actual Weight Non editable Field

The Actual Quantity will be received from YHS through synchronization and will be displayed as a read-only field in AgriERP. Users will not be able to manually edit or update this value in AgriERP.

- Multi variety selection:

While creating Planned Harvest Tickets from either the Web App or Mobile App, the user should be able to select multiple Varieties.

Once a Field is selected, the Variety list should be filtered to show only the Varieties associated with that Field. From the filtered list, the user should be able to select one or more Varieties.

The entered number of tickets should be created separately for each selected Variety.

Business Cases:

- The user can plan and capture Harvest Tickets from multiple entry points based on the user's working context. Tickets can be planned from the Harvest Central tab or the Harvest Ticket Detail screen and captured from the mobile "+" action or the Harvest Central tile, so users do not need to follow only one fixed path.
- Farm Operations Manager can plan Harvest Tickets from the web app when the expected loads are known centrally or when the ticket needs to be reviewed and managed from the back office.
- Field Supervisor can capture Harvest Tickets from the mobile app while working in the field, so harvest load details are captured at the actual point of activity instead of being recorded later through manual communication.
- If a Harvest Ticket is planned from the Harvest Ticket Detail screen, the selected Field and Variety will already be available, helping the user create the ticket quickly and reducing the chance of selecting the wrong field or variety.
- Harvest Tickets can be planned from the Harvest Central tab when the user needs to manage tickets independently from the Work Order screen. This supports cases where the ticket is created first and linked with the related Harvest Work Order later.
- Selecting the driver and every plate from the fleet list keeps the captured data consistent with the fleet registry and avoids typing mistakes in the field.
- The business can track Harvest Tickets against Field and Variety, which helps monitor harvest activity, load progress, and completion status for each field and crop variety.
- The business can track different harvest load stages such as First Load, Last Load, Split Load, and In Progress to improve visibility of harvest progress and avoid duplicate completion records.
- If a Last Load already exists for the same Field and Variety, the user will be notified before creating another Last Load so the business can avoid incorrect or duplicate last load records.
- Users can attach supporting documents or images with the Harvest Ticket from the Farm App, and attachments added in AgriWMS, such as weight certificates, will also be available back in the Farm App for review.
- Harvest Ticket data will be synchronized with AgriWMS so the operational harvest process can continue outside the Farm App while still keeping ticket status visible to Farm App users.
- Once AgriWMS marks the Harvest Ticket as Completed , the Farm App will show a Completed chip next to the Harvest Ticket number so users can easily identify that the ticket has been completed.
- Once the Harvest Ticket is completed, the business will not allow further edit or delete actions to maintain data accuracy and avoid changes after final processing.
- Before posting, the system will ensure that the Harvest Ticket is linked with the relevant project . This prevents unlinked tickets from being posted incorrectly against the ERP project.

- The solution reduces dependency on paper tickets, spreadsheets, and delayed manual updates by allowing Harvest Tickets to be planned, captured, reviewed, synchronized, and posted through a controlled digital process.

Data Dictionary

Field Name	Description	Source	Data Type
Grower	Grower will already exist in the system and will only be displayed on the harvest ticket form as read-only information.	System / Active Harvest Context	String
Farm	Farm will already exist in the system and will only be displayed on the harvest ticket form as read-only information.	System / Active Harvest Context	String
Season	Season will already exist in the system and will only be displayed on the harvest ticket form as read-only information.	System / Active Harvest Context	String
Field	The user will select the field for which the harvest ticket is being created. The field list will be available from the system based on the harvest context.	Farm Web App / Farm Mobile App	String
Variety	Users will select the variety for the harvest ticket. Variety will not be filtered based on the selected field; all available varieties will be shown (Fetch from GP Master data) .	Farm Web App / Farm Mobile App	String
