Harvest Central Testing: Where We Stand

Status report for the Product Manager · 21 October 2026 · QA environment · Prepared by QA (Zujaj Misbah Khan)

1. Summary

Overall: the core features work, but release is not recommended yet.
Planning tickets for several fields and varieties at once works in the web app, and a harvest ticket now goes all the way from the Farm App to the YHS warehouse and into D365. Two things stop us signing off: **(1)** the Field list shows fields that belong to other growers, and some varieties are merged or missing compared with the Grower's Portal contract; **(2)** most tickets reach the warehouse with the **wrong carrier, truck or trailer**, and tickets whose truck has no carrier never reach the warehouse at all. Both need input from other teams.

Area	Status	In one line
Enhancement ADO #26493 (plan tickets for many fields and varieties)	PARTLY 3 of 5 rules pass	Rules 2, 4 and 5 pass. Rule 1 (only Vann fields) fails. Rule 3 (no invalid pairs) passes in the screens but fails against the Grower's Portal contract and through direct server requests.
Harvest ticket details and checks (16 cases)	PARTLY 10 pass, 5 fail	Required fields, delete, last-load override and file type/size checks work. Attachments added on the web are not saved, and the same trailer can be used front and rear.
Full flow: Farm App → warehouse (WMS) → D365	PASS works end to end	18 tickets weighed, posted and confirmed in D365 (journals VBS-000513 to 522 and 531 to 538). Weights and quantities are correct.
Transport details sent to the warehouse	FAIL	Most tickets arrive with a wrong carrier/truck/trailer. Tickets whose truck has no carrier are silently not sent (12 of 20 on Harvest Central 32).
Carrier, driver, truck and trailer lists (vs AgriAdmin)	FAIL duplicates in Farm App	Nothing is missing, but the Farm App lists most items twice. The old copy is picked first and is what sends the wrong details. AgriAdmin itself is clean apart from 2 likely double entries.
Mobile (iOS build 1.3.14 (27))	PARTLY	Mobile attachments work and show on the web. Web attachments do not show on iOS. Mobile planning checks are still pending on the device.

Bugs: 11 bugs raised in ADO by QA on this work (6 Ready for UAT, 2 Ready for QA, 2 Under Discussion, 1 New); see section 6.

2. What was tested

- **ADO #26493**: choosing several fields and varieties at once when planning harvest tickets, and its five acceptance rules (current ADO state: **QA in Progress**).
- **The tickets it creates**: required fields, limits, load types, delete, attachments on web and iOS.
- **The full harvest journey**: Farm App ticket → sent to the YHS warehouse system (AgriWMS) → weighed and placed on a stockpile → weight returned to the Farm App → posted → stock journal in D365.
- **Master data**: the carrier, driver, truck and trailer lists in the Farm App compared with AgriAdmin, the YHS master list.
- **Grower's Portal contract**: the Vann Brothers contract VSM-0EY10-26 compared with what planning offers.

Environment: QA web app (site Colusa, Crop Year 2026), iOS build 1.3.14 (27), AgriWMS QA, AgriAdmin QA, D365 QA. Grower's Portal, AgriAdmin and the sync console were only read, never changed. Test data was created only in the Farm App and the warehouse, as agreed.

3. ADO #26493: results against the five acceptance rules

#	Rule	Result	What we saw
1	Only fields with a valid Grower's Portal contract under the Vann grower are shown	FAIL	All 51 Vann contract fields are shown, but 18 more are too (e.g. 150, 285, 342, "Shop", "Almonds Splits & Meats"). They belong to other growers such as Salt Creek Orchards and Vann Family Two.
2	Varieties come from the chosen fields and their mappings	PARTLY	Works as built: choosing a field shows only its varieties. But compared with the contract, 8 fields are off: BUTTE and PADRE appear as one merged item on 6 fields, and FRITZ, NONPAREIL and INDEPENDENCE are missing on some.
3	No invalid field and variety combinations	PARTLY	The screens never offer an invalid pair. But the server accepts invalid pairs if sent directly (we created and then deleted two test tickets), and the merged varieties above are not on the contract.
4	No duplicate combinations in one planning action	PASS	Duplicates are refused with a clear message. Planning an existing pair adds to its row instead of creating a new one.
5	Each planning record is listed on its own in Harvest Central	PASS	Every field and variety pair gets its own row with its own project and counts.

Automated checks: 16 tests, run on 16 and 19 Oct: 14 pass and 2 fail as expected (rule 1). Manual checks: 9 cases, 7 pass and 2 fail (rule 3 via direct requests).

4. Full harvest journey (Farm App → warehouse → D365)

Harvest Central row	Tickets	Result	Notes
27: field 311 / BUTTE (20 Oct)	10	DONE all posted	Weighed 62,000 / 18,000 / net 44,000 lbs. 5 tickets first failed to sync because the truck had no carrier; a truck with a carrier was picked and they went through. D365 journals VBS-000513 to 522 confirmed.
32: field 342 / WOOD COLONY (21 Oct)	20	PARTLY 8 posted, 12 blocked	8 reached the warehouse and were weighed, assigned to stockpile 1000-07, posted, and confirmed in D365 (VBS-000531 to 538, 44,000 each). 12 never reached the warehouse: their trucks have no carrier, even in AgriAdmin.
26: field 285 / CARMEL (19-20 Oct)	300 planned	BLOCKED stopped after 3	Goal was to attach files and check them on iOS. Stopped because files added on the web are not saved to the ticket.
Single test ticket HT-285-0T7B9-26 (20 Oct)	1	PENDING	Weighed and assigned in the warehouse; not yet posted.

What D365 receives: one posted "Movement" journal per ticket, item 90000 with the variety, warehouse 0401 / location YHS, batch "variety-field-2026", quantity = net weight. The journal lines carry no project.

5. Carrier, driver, truck and trailer data

Type	In AgriAdmin	In Farm App	Listed twice in Farm App	Only in Farm App
Carriers	105	198	86	6 (test entries)
Drivers	357	666	112	197
Trucks	472	773	299	2
Trailers	4,172	8,058	3,849	37

- Each item exists as an old copy (sample data loaded in June) and a new copy. The ticket form picks the old copy first, and the old copy points to the wrong warehouse record. Of the 28 tickets synced up to 20 Oct, 24 arrived with the wrong carrier and truck; on 21 Oct, 7 of 8 had at least one wrong item.
- 186 of 472 trucks in AgriAdmin have no carrier. Any ticket using one of them never reaches the warehouse, and the user is not told.
- AgriAdmin has no exact duplicates. Two entries look like the same thing entered twice: driver "Saavedra, Antonio" / "Antonio Saavedra" and trailer "102A" / "102 A".

6. Bugs

Raised in ADO (status read from ADO on 21 Oct 2026, 13:42)

ADO	Problem (plain words)	Priority	Status	With
26706	Warehouse tickets show the wrong carrier, driver, truck and trailers	High	Ready for QA	Mohsin Aqee
26707	Ticket whose truck has no carrier silently never reaches the warehouse	Medium	Under Discussion	Wania Aslam
26708	Manual ticket number is not passed to the warehouse	Medium	Under Discussion	Wania Aslam
26709	Manual ticket number: Farm App allows 64 characters, warehouse only 50	Medium	Ready for QA	QA
26704	Manual ticket number over 64 characters crashes the save and shows a database error	Medium	Ready for UAT	Mohsin Aqee
26705	iOS: attachment and ticket sync failure on 306 / BUTTE/PADRE	Medium	Ready for UAT	M. Haseeb Siddiqui
26710	iOS: an edited ticket's attachment shows a double file extension	Medium	Ready for UAT	Mohsin Aqee
26712	Trailer plate list loads slowly on the ticket screen (load it gradually)	Medium	Ready for UAT	M. Haseeb Siddiqui
26686	Wrong time in the "Planned On" column	Medium	Ready for UAT	Mohsin Aqee
26688	Wrong time in the "Updated Date/Time" column	Medium	Ready for UAT	Mohsin Aqee
26565	Remove unneeded growers from the web and iOS apps	Medium	New	Mohsin Aqee

Related, raised earlier by others: ADO 26023 "Attachment is not saving on the Edit Harvest ticket" (New since 29 Aug).
Note: ADO 26706 moved to Ready for QA today, but today's run (synced at 12:15 local time) still sent wrong details, so it needs a retest once the fix is confirmed as deployed.

7. Execution log and challenges

Date	What we did	Challenges met
16 Oct	Release 1 checked on QA. 16 automated tests written and run (14 pass, 2 expected fail). 9 manual planning cases (7 pass, 2 fail). Fields compared with the Grower's Portal.	Web planning was broken until a fix deployed at 16:55 (server and screen out of step). The API documentation page was empty, so new endpoints had to be worked out by observation. A sync job logged an error.
17 Oct	Ticket checks and attachments: 16 cases (10 pass, 5 fail, 1 observation).	Web attachments looked saved in the form but were never stored. One test ticket disappeared with no record of who removed it.
19 Oct	Full rerun of rules 1-5 (no change). Investigated web attachments missing on iOS. Read the sync logs between the Farm App and the warehouse. Raised ADO 26704 to 26709. Started attaching files to 300 planned tickets on 285 / CARMEL.	Stopped the 300-ticket upload after 3 because web attachments do not save. Sync logs needed a separate login with an emailed code. The QA site was slow (main page files took 36-43 s to load).
20 Oct	Checked rules 1-3 against the Vann contract VSM-0EY10-26. Ran the first full journey: 10 tickets on 311 / BUTTE weighed, posted and confirmed in D365. Compared the Farm App lists with AgriAdmin.	5 tickets would not sync until a truck with a carrier was chosen (there is no Carrier field on the form). Posting failed in batches until the page was reloaded. The warehouse login needed a newly set-up PIN. D365 access expired mid-run.
21 Oct	Checked AgriAdmin for duplicates. Ran Harvest Central 32: 8 tickets weighed, posted and confirmed in D365; 12 blocked.	The first stockpile chosen was refused although shown as empty. The Farm App page sometimes loaded blank. The D365 and ADO access keys expired and had to be renewed twice.

Recurring challenges: short-lived access keys for D365, ADO and the sync console; Grower's Portal is read-only for us, so contract changes cannot be tested end to end; only one Vann contract (VFO) was available, and the YHS contracts were not; some test rows cannot be deleted (no delete option), so a little test data remains on QA.
