Executive Summary

AgriProduction (for Hullers) is an integrated Production Management System designed specifically for agricultural hullers. It digitizes the entire in-plant production lifecycle - from precleaning and production runs to yield tracking, by-product handling, and finished goods output.

AgriProduction enables real-time visibility into what is being processed, where it is in the plant, how much yield is produced, and what losses or variances occur, while staying fully synchronized with ERP and inventory systems.

This solution includes following two applications:

- ***Web Application (Huller)*** *- Production manager.*
- ***Kiosk/Tablet Application (Huller)*** *- Production supervisor, line production floor workers.*

The goal is to improve **production traceability, accuracy, compliance, and operational efficiency** through automation, real-time synchronizations, and integration with other systems.

This document defines functional behavior, workflows, system boundaries, and integration expectations for development.

Problem Statement

Traditional huller operations rely on **paperwork and isolated systems** for production operations, resulting in:

- **Inaccurate** production and yield data
- **Delayed** visibility into losses, shrink, and downtime.
- **Delayed** and **unclear instructions** for Production Supervisors and Production Floor workers
- **Manual effort** to sync and **lack** of real time visibility of into other systems due to lack of integrations
- **Human errors** due to lack of weighing scale integration.

Solution Overview

AgriProduction replaces manual and disconnected production processes with a **single, integrated production management and execution platform** that:

- Seamlessly integrates **plant-floor hardware** (weighing scales, barcode/QR scanners, label printers) with **digital production workflows**.
- Offers end-to-end **traceability** from **raw material & rejects intake → processing stages → finished goods output.**

- Provides **live production dashboards**, **audit logs,** and **operational reporting**.
- Real-time integration with **Dynamics 365** and other systems ensures production, warehousing, quality and inventory data stays accurate and in sync.

The following items are part of this document's scope:

- Digital production management for nut processing, including precleaning and production (hulling and shelling).
- Intake of raw materials or rejects from handlers, respecting batch attributes at every step.
- Management of production resources including operators, supervisors, processing lines, machines, and associated equipment used during production execution
- Tracking of material movement through production stages, including transitions between processing lines, tanks, bins and staging areas
- Batch- and lot-level tracking of inputs, in production inventory, production output, including yield and by-product.
- Production of output (kernels and inshells) in bins or bulk based on their designated chutes.
- Production of byproducts/ rejects such as hash and rejects received from handlers.
- Generation of new bin IDs and reuse of previous ones.
- Role-based user access for production managers, production supervisors, and floor operators, with controlled permissions by function and responsibility.
- Visibility for internal stakeholders and downstream handlers into production status, output quantities, and available finished goods inventory.
- ERP synchronization to update production output and consumption data in real time during processing and production completion.
- Tank status management is available within the AgriProduction Kiosk/Tab app, allowing users to update tank statuses (e.g., Full, In Use, Empty, Closed). All status changes are logged with user identity and timestamp and synchronized across AgriProduction and connected systems.
- Capturing and reporting of duration of each production and preclean order.
- Integration with ERP, AgriWMS and AgriQuality.
- 4 digit pin and job card scanning based log in.

The following items are **not** part of this document's scope:

- Integration with ERP to post cost of consumption on production order.
- IoT-driven automation (e.g., automated sensors, machine control, or autonomous processing), which is planned for a future roadmap phase.

Summary

AgriProduction (Processor) is a production management application designed exclusively for agricultural processors, tightly integrated with the ERP, AgriWMS & AgriQuality systems as part

of a unified end-to-end processing and operations ecosystem.

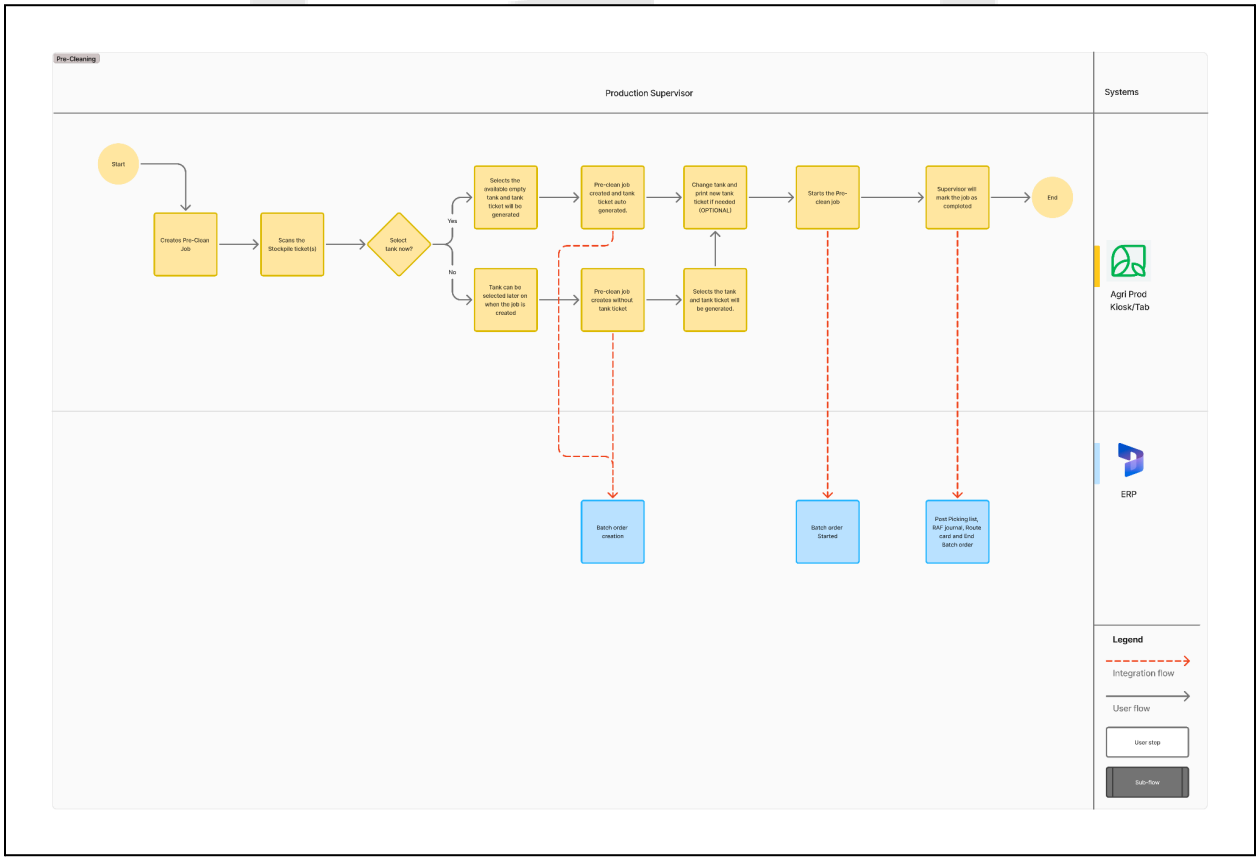

Core functionality includes:

- **Integration with plant-floor scales** to capture accurate weights at critical production and processing stages.
- **Inventory tracking across production stages**, such as raw material, pre-cleaned, in-shell, kernel, by-products, and waste streams.
- **Processing lifecycle management**, tracking material movement from intake through each transformation stage to finished goods.
- **Inventory on-hand visibility** reflecting accurate production and processed inventory positions.
- **Tracking of processed output by bins or trailers**, ensuring full traceability through to staging or shipment readiness.

UI & UX (Wireframes & Designs)

Prototype Application links:

1. AgriProduction Web App
2. AgriProduction Kiosk/Tablet App

UI & UX features:

1. Column options (hide, show columns) on tables. Users will be able to add & remove columns and save it as their preference (refer prototype)
2. Sorting of the columns on tables and ability to save it as preference on user level
3. Two views of the tables i.e. table view and card view (refer prototype)

4. Drop down list view of growers, handlers, product type, variety, farming type (organic and conventional) and locations etc.
5. Scanner camera for QR code, LP and employee badge scanning.
6. Widgets for weighing scale, KPIs etc.
7. Accordions / sections to differentiate different types of fields.

App Users

App Access	Roles	Description
Web App	Production Manager	Responsible for monitoring the precleaning, planning / creating production orders for hulling and shelling , closing the tanks and completing the order when the production run gets completed.
Kiosk/Tab App	Production Supervisor	Responsible for creating and executing the precleaning jobs, manages production work by starting and pausing / stopping the production jobs for floor workers.
Kiosk/Tab App	Floor Workers	Responsible for executing the assigned production jobs by recording the output produced in the system.

Persona 1 | Production Manager

Name: Sarah
Role: Production manager
Responsibilities:

- Monitor the precleaning jobs. Print / reprint tank tickets.
- Managing production by creating and completing the production orders, including assigning operators. Managing tanks by closing them when the tank is emptied during production.
- Review and monitor all pending production jobs that remain incomplete.

Challenges:

- Using fragmented and isolated systems
- Lack of real-time status of production stages and inventory

Goals:

- Manage the production effectively and efficiently with timely completion of orders. Having the produced inventory ready before delivery is due.
- Have easy and automated processes that make her life easier.
- Less manual effort.
- Easy and real time visibility of the data, status and progress of the production.

Production Manager User Journey:

User:

1. Sarah: Production manager | AgirProduction Web Application

View Pre-cleaning Jobs

Sarah | Production Manager

1. Sarah logs in to the AgirProduction Web App.
2. She views all the Pre-clean jobs with their status.
3. She opens a precleaning job and sees the operators, duration and other related details.
4. She prints / reprints tank tickets if needed.

Production Orders Creation & Completion

Sarah | Production Manager

1. Sarah logs in to the AgirProduction Web App.
2. She navigates to the “Production” module in the AgirProduction Web App.
3. All Production orders with their status will be displayed
4. She creates “New Production Order’ and selects:
    a. Production date
    b. Selects Output type (Inshell or Kernel)
    c. Selects Product type (Bin or Bulk)
    d. Decision: “Scan tank ticket now?”
        i. Yes → Scans or Enter Tank ID. *(Multiple same GFV selection allowed by the system)*
        ii. No → Selects the tank later on.
    e. Optional: Select any resource (Selecting a resource will not bind the production order to that resource. It will remain visible to all floor workers and supervisors once the run has started)

    f. She finally creates the production run / order.
5. Production order is successfully created. *(Integration with ERP: Batch order gets created)*
6. In case the bin tag is missing, she can scan the Bin Label ID or click on “Print Label.” The system will prompt her to print either a Bin Tag or a Bin Label ID. She should select “Bin Tag” to print the bin tag.

(Refer Persona 2 > Production Order Supervision Journey for continuation)

---

22. Sarah views the production order and marks the Production order as “Complete”. *Integration with ERP: Batch Order gets completed, Post Picklist, RAF and Route card)*

Persona 2 | Production supervisor

Name: David
Role: Production supervisor
Responsibilities:

- Creating and managing Pre-clean jobs
- Managing tanks by closing them after it gets emptied or removing them from production orders.
- Supervising the production by starting and completing the production orders created and assigned by the Production Manager.

Challenges:

- Monitoring job progress in real time across multiple operators, shifts, and production areas.
- Managing frequent production changes (priority shifts, urgent orders, downtime).
- Avoiding mistakes caused by unclear instructions, delayed updates, or miscommunication between teams.
- Ensuring operators follow the correct sequence of steps and record required production details accurately.

Goals:

- Have clear and simple visibility into what needs to be scheduled, started, monitored, or completed.
- Minimize manual follow-ups, paper tracking, and repetitive status checks.

Production Supervisor User Journey:

User:

1. David: Production Supervisor | AgriProduction Kiosk / Tablet

Pre-cleaning Journey

David **| Production Supervisor (Supervisor)**

1. David logs in and opens the “Pre-cleaning module” on the AgriProduction Kiosk/Tablet app.
2. He clicks on “Create Pre-Clean Job”.
3. He selects the Harvest Load ticket(s) manually or scans the ticket(s) barcode. (Only tickets that are in the staging status will be displayed.). *The system will allow multiple same GFV selections.*
4. **Decision:** “Select tank now?”
    a. Yes → He selects the tank. The system only shows empty tanks.
    b. No → Tank can be selected later on when the job is created
5. The pre-clean job is successfully created. (If tank is selected than tank ticket will be auto generated at this point)
6. Opens the created Pre-clean job.
7. If the tank was not selected earlier, David will select the Tank and the tank ticket will be generated. (Only empty tanks will appear for selection)
8. David now starts the Pre-cleaning job.
9. The driver unloads the field run almonds into the pit.
10. David completes the job when the tank is filled.
11. [Optional] If David’s shift ends then another supervisor will log in. The job will remain resumed. When the tank is filled the other supervisor will simply complete the job. (jobs will be visible to all supervisors).
12. Upon completion the Field run almonds will become cleaned almonds and they will be transferred to the selected tank.

Production Order Supervision

David | Supervisor (Supervisor)

6. David logs in to the Kiosk / Tablet app and navigates to the “Production” module in AgirProduction Web App.
7. All Production orders with their status will be displayed.
8. Select any active Production order.
9. Decision: “Was the tank selected by the Production Manager?”
    a. Yes → Starts the Production Order. *Integration with ERP: Batch order starts*
    b. No → He scans / selects the tank ticket(s) and then starts the Production Order. *The system allows multiple selection of the same GFV. Integration with ERP: Batch order starts*
10. [Optional] David can also execute the production order on behalf of the production floor operator and he can void the bins if there is any issue or are mistakenly produced by floor workers. *Integration with ERP: Update registration*

(Refer Persona 3 > Production Order Execution Journey for continuation)

---

20. After the Production process is ended, David closes the selected tanks. *This is a mandatory step otherwise production will not end.*
21. After tank closure he ends the Production Order.

(Refer Persona 1 > Production Order Creation & Completion Journey Part 2 for continuation)

Persona 3 | Floor Workers

Name: Carlos
Role: Production Floor worker
Responsibilities:

- Mark Check in and Check outs
- Ensure assigned Production orders are running.
- Ensure correct labels are printed and attached to the bins.
- Ensure weights are accurately captured.

Challenges:

- Relying on paper tickets.
- Avoiding mistakes caused by unclear instructions or miscommunication.
- Lack of integration b/w scale and the production system.
- Wrong weight captures.

Goals:

- Have clear & simple instructions.
- Minimize manual checks and paperwork.

Production Floor Workers User Journey:

User:

1. Carlos: Production floor worker | AgriProduction Kiosk/Tab Application

Production Order Execution

Carlos | Production floor worker

11. Carlos logs in to the AgriProduction Tablet/Kiosk app.
12. He goes to the Production module in the app.
13. Only “Running/Active” production orders will be visible to floor workers.
14. He selects the Production Order.
15. [Optional] He can select the production chute right now or after scanning.
16. He scans the container bin tag or trailer license place.
17. In case a bin tag is missing or damaged, He will click on “Generate New” to create a new bin tag. The system will generate the tag sequentially and to which the bin label ID will

be assigned. (Only the Web Manager can print the bin tag, which will then be attached to the bin.)

18. Decision: “Was the Chute selected earlier?”
    a. Yes → Continue.
    b. No → Selects the chute
19. The system automatically fetches whether it is bulk or bin and whether it is kernels, inshells or rejects / byproducts based on the mappings.
20. The selected chute was the:
    a. Chute that directs Kernels in Bins:
        i. The system automatically captures the tare weight.
        ii. The system automatically captures the gross weight after bins are filled. *Integration with ERP: Update Registration*
        iii. Carlos prints the label and pastes it on the bin.
    b. Chute that directs Inshells in Bulk:
        i. The tare weight of the trailer gets captured at front scale or from the database.
        ii. Carlos gets the trailer filled.
        iii. The trailer goes to the front office for gross weight capture.
        iv. The front office captures gross weight. *Integration with ERP: Update Registration*
        v. Bulk load tag gets generated by the system.
    c. Chute that directs Inshells in Bins:
        i. The system automatically captures the tare weight.
        ii. The system automatically captures the gross weight after bins are filled. *Integration with ERP: Update Registration*
        iii. Carlos prints the label and pastes it on the bin.
    d. Chute that directs Rejects in Bins:
        i. Carlos captures the tare weight manually and records it in the system.
        ii. He fills the bin and takes it to the manual weighing scale.
        iii. He captures the gross and records it in the system manually. *Integration with ERP: Update Registration*
        iv. Carlos prints the label and pastes it on the bin.

(Refer Persona 2 > Production Order Supervision Journey second section for continuation)

Technical & Other Details

Data Source Guidelines

AgriProduction is part of a broader ecosystem of applications supporting grower, processor, and handler operations. From a business perspective, reference and master data created within any application must be consistently available across all relevant applications (AgriERP, AgriWMS, AgriQuality and AgriProduction App). Users should not be required to recreate the same data in multiple systems.

How this is achieved is an architectural decision and may be implemented through a shared data source, synchronized databases, or other integration mechanisms. No design decisions should restrict the availability or flow of data between applications.

List of Master Data

1. Growers (Sync from Grower Portal to ERP and AgriWMS & Agri App - FDD link pending) - Read Only
2. Handlers (Sync from Grower Portal to ERP and WH & QC App - FDD link pending) - Read Only
3. Fields - (Already in AgriERP or GrowerPortal need to sync to Apps) - Read only
4. Items - (Item basic data will sync from ERP to Apps - FDD Link) - Read Only
5. Variety (Item basic data will sync from Growers Portal to Apps - FDD Link) - Read Only
6. Locations - (Created in Apps and sync to ERP to Apps - FDD Link) - Read Only
7. Trailers (Only in Apps) - Read Only
8. Equipment - CRUD
9. Chutes - CRUD

Configurational Data and Mappings

Following contains the configurational data and mappings that will be required initially. Refer to the Summary sheet to see sub-sheets relevant for production.
YHS - Data & Mappings

Key Modules & Features

This section contains two lists: a high-level overview of key modules and features, and a detailed breakdown of features and sub-features, ensuring both a broad scope and in-depth implementation guidance.

1. **High Level Modules & Features:**

Module	Platform	Description	Key Features & Details
Dashboard	Both	Overview of live KPIs	Overview of Production, Shipment & Inventory
Production	Both	Process Pre-cleaned almonds from the tanks	Scale capture (integration), manual weight capture, Label printing, New Bin ID generation, Tank ticket, Bin ID label and trailer LP scanning, Production based on chutes mapping with product type & packaging type and integration with ERP to update inventory and production status.
Inventory	Both	Monitor products by stage	Field run almonds, Inshells, Kernels and Rejects. Conventional & Organic. On hand inventory views.
Pre-clean	Both	Cleaning process for dumped field-run almonds into tank	Scanning of stockpile/load tickets , Starting/stopping Pre-clean, printing/reprinting tank tickets.
Scanner	Both	Scanning	Stockpile/load ticket scanning, tank ticket scanning, Bin & Bin serial label scanning and trailer licence scanning
Reports	Web	Generate reports	Production runs, Pre-clean runs, Bins created, Stockpile Inventory, Planned for Production Inventory, Production Duration, Reporting by grower, field, variety etc.

Profile	Both	Manage user preferences	Language, Security (Password & Pin), Preferences, Sign-out, 4 digit pin or job card scanning based sign in
Settings	Web	Manage application settings	Master Data Management, User Management, Label Designing

2. **Detailed Features List:**

The following spreadsheet contains features and sub-features list. Navigate to the sub-sheet “App Areas” and filter on App Name = Production, Production Web and Production Kiosk to refer to AgriProduction features list.

Features list Spreadsheet Link: VB P3 YHS Apps Feature List

Formula Calculations:

Production:

- Net Weight = Gross Weight (from scale) - Tare Weight (from scale)

Integrations & System Fields

1. **Integration with ERP:**
    a. 03-FDD-Almonds Precleaning Batch Order Creation Integration.docx
    b. 04-FDD-Precleaning and Tank Storage BO Integration.docx
    c. Production Batch order creation and processing: 05-FDD-Hulling and Shelling BO Integration.docx
2. **Fields:** YHS Prod - Required Fields for Prod

Validation Rules, Error Handling & Notifications

Following spreadsheet contains validation rules, errors & notifications:

AgriProd | Errors, Validations, Notifications

1. The sub-sheet “Errors” contains the errors handling
2. The sub-sheet “Validations & Alerts” contains validations and alerts.

Production Setup / Settings Module & Login Functionality

A Settings menu will be added to the Production application, providing access to administrators for master data and user management. The Settings module will include the following areas:

1. User Management

- Create and manage application users
- Assign and manage user roles and permissions
- Activate or deactivate users as required

YHS Prod - Permission Matrix

2. Master Data Management

The Settings module will allow creation and maintenance of core master data mentioned in the “List of Master Data” section.

“List of Master Data” section

3. Login Criteria

The sign-in screen of apps will only include a scanning of card option and an option of 4 digit pin to sign in. No email ID and password log in required.

Use Cases

Following is the spreadsheet containing the use cases. Refer Use Cases and filter on the App (All and Production) to filter out Production use cases.

Use Cases Sheet: Use Cases

Future Considerations

- Production planning and scheduling
- Notifications
- AI Driver operational insights
- Advanced inventory traceability (including inventory search by filters with backdate)
- Integration with ERP to post cost of consumption on production order.
- IoT-driven automation (e.g., automated sensors, machine control, or autonomous processing)
- Closer integration with QC to generate automated quality orders.

Updates: Version 1.1 (Draft)

Precleaning Module (Web)

The Pre-Clean screen is used to manage and monitor pre-cleaning operations performed on field-run almonds before they enter the main production process. Pre-cleaning removes debris and prepares almonds for further processing such as hulling or shelling. The screen allows users to create new pre-cleaning jobs, monitor job progress, and review operational details including grower information, field origin, variety, equipment used, and processed quantities. The interface includes job summary indicators, filtering options, search functionality, and a job listing grid.

Pre-Cleaning (Web) - Main Screen

1. **Pre-cleaning (Web) Summary**

Field Name	Description
Total Jobs	Displays the total number of pre-cleaning jobs created in the system. Calculated from all job records.
Planned	Displays the number of jobs that are created but not yet started. Calculated where status = Planned.
In Progress	Displays the number of jobs currently being executed. Calculated where status = In Progress.
Completed	Displays the number of jobs that have been completed successfully. Calculated where status = Completed.

2. **Search Field**

Pre-Clean Job Search
The screen provides a search bar that allows users to locate specific pre-clean jobs quickly. Users can search using multiple identifiers including Job Number, Grower Name, Variety, or Ticket Number. The system filters the grid results based on the entered search criteria.

3. Pre-clean job Filters

The filter panel allows users to refine the list of pre-clean jobs based on operational attributes.

Field Name	Description	Example / Available Values
Job Status Filter	Allows users to filter jobs based on execution status to focus on specific stages of the process.	Planned, In Progress, Completed
Grower Filter	Allows users to filter jobs by the grower associated with the almonds being processed.	Anderson Farms, Vann Brothers, Golden Valley Growers, Bannister Farms
Variety Filter	Allows users to filter jobs based on the almond variety being processed.	Nonpareil, Butte, Carmel, Fritz
Field Filter	Allows users to filter jobs based on the agricultural field of origin.	Field A-1, Field 14B, Field C-1, North Section, Field A-2
Date Range Filter	Allows users to filter jobs based on a defined date range using From Date and To Date.	From Date – To Date

4. Pre-Clean Job Grid Fields

Each row in the grid represents a single pre-clean job and displays detailed operational information.

Field Name	Description	Example / Available Values
Job Number	Unique identifier assigned to each pre-cleaning job, used as the primary tracking reference.	PCJ-00048
Date	Displays the date on which the pre-clean job was created or scheduled.	01/03/2025

Created By	Displays the user who created the job in the system for audit traceability.	Joyel Ibara, Emily Davis, David Luke
Job ID	Internal system identifier used to track the job execution process.	PC-0126
Ticket Number	Displays the field run ticket associated with the almonds being processed.	HT-45321-001
Grower	Displays the grower associated with the almonds being processed.	Anderson Farms, Vann Brothers, Golden Valley Growers, Bannister Farms
Variety	Displays the almond variety being processed during the job.	Nonpareil, Butte, Carmel, Fritz
Equipment	Indicates the pre-cleaning equipment used to perform the job.	Pre-Cleaner #1, Pre-Cleaner #2, Pre-Cleaner #3
Processed Quantity	Represents the quantity of almonds processed during the job (in lbs).	45,000 lbs, 30,000 lbs, 28,000 lbs

1. **Action Fields**

1. **New Job**
   The New Job button allows users to create a new pre-clean job. When selected, the system opens the job creation interface where users select field run tickets, assign equipment, and define processing parameters.
2. **Export**
   The Export option allows users to export the pre-clean job grid data for reporting and analysis purposes.

Preclean (Web) - Creation Screen

1. **Ticket Selection Screen**

The **Create Pre-Clean Job screen** is used to initiate a new pre-cleaning operation by selecting the incoming load tickets that will be processed. This screen represents the first step in the

pre-clean job creation workflow and enables users to identify the field-run inventory that will be sent to the pre-cleaning process.

The workflow is divided into four sequential stages: **Tickets, Tank, Configuration, and Done**. The current screen represents **Step 1 – Ticket Selection**, where users scan or select load tickets associated with the almonds to be processed.

Workflow Steps

The job creation process follows a structured multi-step workflow to ensure that all required operational parameters are defined before the job is executed.

Step 1 – Tickets
Users identify and select the field run load tickets that contain the almonds to be pre-cleaned.

Step 2 – Tank
Users select the empty storage tank where the cleaned almonds will be stored after the pre-cleaning process.

Preclean Job Creation Fields

Field Name	Description	Example / Available Values
Scan Ticket	Allows users to scan the barcode on a field run load ticket. The system retrieves associated details such as grower, field, variety, and load information and adds the ticket to the job input list. Ensures accurate traceability between receiving and processing.	Barcode scan
Browse Tickets	Allows users to view and select from a list of available field run tickets eligible for pre-cleaning. Useful when scanning is not available or when reviewing multiple tickets.	Ticket selection list
Scan Load Ticket Area	Dedicated interface area for scanning load ticket barcodes using a mobile device or scanner. Automatically adds scanned tickets to the job.	Scan interface
Manual Ticket Entry	Allows users to manually enter a ticket number when scanning is not available. The entered ticket can be added to the job using the Add action.	HT-45321-001
Cancel	Closes the job creation screen without saving any data entered by the user.	UI Action

Preclean (Web) - Details Screen

The **Pre-Clean Job Summary screen** provides a consolidated view of a completed pre-clean job. This screen allows supervisors and operations staff to review the load ticket details, processed weight, destination tank assignment, operators involved in the process, and the overall job timeline. It also provides the option to print or reprint the **tank ticket** generated after the completion of the pre-clean process.

1. **Pre-Clean Job Details - Header**

The header section displays the identification and current status of the pre-clean job.

Field Name	Description	Example / Values
Pre-Clean Job Number	Displays the unique identifier assigned to the pre-clean job.	PCJ-00048
Job ID	Displays the internal job identifier associated with the system record.	PC-0126
Status	Indicates the completion status of the pre-clean job.	Completed
Print Tank Ticket	Provides an option to generate and print the tank ticket for the load.	UI Action
Reprint	Allows the user to reprint an already generated tank ticket if required.	UI Action

2. **Job Summary Metrics**

The system displays key operational metrics associated with the job.

Field Name	Description	Example / Values
Expected Weight	Displays the expected weight of almonds based on assigned field run tickets.	45,000 lbs
Processed Weight	Displays the actual weight processed through the pre-clean equipment.	45,000 lbs
Equipment	Identifies the pre-cleaning machine used for the job.	Pre-Cleaner #1
Operators	Displays the total number of operators assigned to the job.	Numeric value (e.g., 2)

3. **Load Ticket Information Section**

The **Load Ticket section** provides details of the field run ticket processed during the job.

Field Name	Description	Example / Available Values
Ticket Number	Displays the unique field run ticket identifier.	HT-45321-001
Grower	Displays the grower associated with the delivered almonds.	Anderson Farms
Field	Displays the field from which the almonds were harvested.	Field A-1
Variety	Displays the almond variety contained in the load.	Nonpareil
Handler	Displays the handler or orchard responsible for delivering the almonds.	Vann Family Orchards
Driver	Displays the driver responsible for transporting the load.	Driver Name
Carrier	Displays the transport company responsible for the delivery.	Carrier Name
Truck / Trailer	Displays the truck and trailer identification used for the delivery.	TRK-001 / TRL-009
Gross Weight	Represents the total weight of the loaded truck including the product.	46,500 lbs
Tare Weight	Represents the weight of the empty truck or trailer.	1,500 lbs
Net Weight	Represents the actual weight of almonds delivered after subtracting tare weight from gross weight.	45,000 lbs
Location	Displays the stockpile or receiving location where the almonds were recorded.	Stockpile Area A
Status	Displays the ticket usage status.	Used

4. Destination Tank

The **Destination Tank section** displays the tank where the cleaned almonds were transferred after pre-cleaning.

Field Name	Description	Example / Available Values
Tank Number	Displays the tank assigned to store the cleaned almonds.	Tank 1
Tank Code	Displays the internal identifier assigned to the tank.	TK-T01
Plant	Displays the facility where the tank is located.	Plant 1
Assignment ID	Represents the system-generated identifier for the tank assignment record.	System-generated ID
Variety	Displays the almond variety stored in the tank.	Nonpareil
Grower	Displays the grower associated with the almonds stored in the tank.	Anderson Farms
Run Type	Indicates the processing category for the stored almonds.	Meats
Tank Fill Indicator	Displays the tank utilization and current stored weight.	135k lbs stored
Tank Status	Indicates the current state of the tank after the job.	Closed

1. **Assigned Operators**

The **Assigned Operators section** lists the operators responsible for executing the pre-clean job.

Each operator record displays:

- Operator Name
- Operator Identifier

Example:
David Luke – USR-001
Sarah Johnson – USR-002

2. **Timeline**

The **Timeline section** records the key lifecycle events associated with the pre-clean job.

1. **Created**
   Displays the timestamp when the job was created.
2. **Started**
   Displays the timestamp when the pre-clean job execution began.
3. **Completed**
   Displays the timestamp when the job finished processing.
4. **Tank Ticket Generated**
   Displays the identifier of the tank ticket generated for the cleaned inventory.

Example:
TKT-9738873

Precleaning Module (Kiosk/Tablet)

Pre-Clean Dashboard - Main Screen

The **Pre-Clean Dashboard** provides a centralized view of all pre-cleaning jobs within the system. It enables supervisors to create new jobs, monitor job statuses, and quickly access job details for execution or review.

1. **Create Pre-Clean Job**

The **Create Pre-Clean Job** button allows users to initiate a new pre-clean job. Selecting this option opens the job creation interface where users can select field run tickets, assign equipment, and configure processing details.

2. **Jobs Summary**

The **Jobs Summary section** provides a quick overview of pre-clean job distribution across different statuses.

Field Name	**Description**
Active Jobs	Displays the total number of pre-clean jobs currently in the system.
Running	Displays the number of jobs currently in execution.
Planned	Displays the number of jobs that are created but not yet started.

This section helps supervisors quickly assess workload and operational status.

3. **Pre-Clean Jobs List**

The **Pre-Clean Jobs section** displays a list of all jobs along with key summary information for each job. Each row represents an individual pre-clean job and provides quick insights into its current state.

Field Name	Description
Job Number	Displays the unique identifier of the pre-clean job.
Status	Indicates the current status of the job (e.g., Planned, In Progress).
Grower & Variety	Displays the grower and almond variety associated with the job.

Ticket Information	Displays the associated ticket number, load weight, and date.
Navigation Arrow	Allows users to open the detailed job screen for further actions.

4. **Job Status Indicators**

Each job displays a visual status indicator to help users quickly identify its stage:

- **Planned** – Job is created but not yet started
- **In Progress** – Job is currently being executed

These indicators enable quick decision-making and prioritization.

Preclean (Kiosk/Tablet) - Creation

The **Create Pre-Clean Job** screen is used to initiate a new pre-cleaning job in the system. In this step, the user selects one or more **Field Run Tickets** that represent incoming almond loads delivered from the field. These tickets will be processed by the pre-cleaning equipment before the almonds are transferred to storage tanks or production.

1. **Search Field**

The **Search field** allows the user to quickly locate available field run tickets.

The user can search using the following attributes:

Ticket number
Grower name
Variety
Field

Example placeholder text:
Search by ticket, grower, variety, field.

The system dynamically filters the ticket list based on the entered search criteria.

2. **Available Tickets Indicator**

The system displays the number of tickets available for selection.

Example:
4 tickets available.

This helps the operator quickly understand how many loads are ready to be assigned to a pre-clean job.

3. **Tank Selection**

The operator selects one tank from the list to include in the pre-clean job. This tank represents the loads that will be processed during the job.

4. Job Header

The header section displays the job identifier along with its current status.

Field Name	Description	Example / Values
Job Number	Displays the unique identifier of the pre-clean job.	PCJ-80951
Grower and Variety	Displays the grower and almond variety associated with the job.	Anderson Farms – Nonpareil
Job Status	Indicates that the job is currently in a non-executing state.	Planned / Job Stopped

5. Job Details

The **Job Details section** provides key information configured during job creation.

Field Name	Description	Example / Values
Grower	Displays the grower associated with the almonds being processed.	Anderson Farms
Variety	Displays the almond variety selected for the job.	Nonpareil
Ticket Number	Displays the primary field run ticket linked to the job.	HT-45321-003
Equipment	Displays the pre-cleaning equipment assigned to the job.	Pre-Cleaner #1
Expected Weight	Displays the expected quantity of almonds to be processed based on tickets.	41,000 lbs

6. Load Tickets

The **Load Tickets section** displays all field run tickets associated with the pre-clean job.

Each ticket entry includes:

1. Ticket Number
2. Grower
3. Variety
4. Load Weight

Example:
HT-45321-003 – Anderson Farms – Nonpareil – 41,000 lbs.

The system enforces a **matching rule**, ensuring that all tickets added to the job belong to the same grower and variety. A visual indicator confirms the matching criteria.

Users can also add additional tickets using the input field, provided they meet the matching conditions.

7. Destination Tank

The **Destination Tank section** displays the tank selected to store cleaned almonds after processing.

1. **Tank Number and Code**
   Displays the selected tank and its internal identifier.
   Example: Tank 3 – TK-T03.
2. **Plant**
   Displays the facility where the tank is located.
   Example: Plant 1.
3. **Change Option**
   Allows the user to modify the assigned tank before starting the job. Only empty tanks are available for selection to prevent inventory mixing.

8. Status

The **Status section** confirms the current lifecycle stage of the job.

Example: Planned.

It also displays the job creation date for reference.

10. Start Pre-Clean Job

The **Start Pre-Clean Job** button initiates the execution of the job.

Once selected:

- The job status changes from Planned to In Progress.
- The system begins tracking processed weight and duration.

- The assigned equipment and destination tank become active for processing.

Preclean (Kiosk/Tablet) - Details Screen

The **Pre-Clean Job Execution screen** allows operators to execute and monitor the almond pre-cleaning process before almonds are transferred to storage tanks or further production. This screen provides real-time visibility into processed weight, load tickets associated with the job, destination tank assignment, and the current processing status.

The screen is typically used by floor supervisors or machine operators responsible for operating pre-cleaning equipment.

1. **Pre-Clean Job Header**

The header section identifies the job currently being executed.

1. **Pre-Clean Job Number**
   Displays the unique identifier assigned to the pre-clean job.
   Example: PCJ-00048.
2. **Grower and Variety**
   Displays the grower and almond variety associated with the incoming load being processed.
   Example: Anderson Farms – Nonpareil.
3. **Pre-Clean Status**
   Displays the operational state of the job.
   Example: Pre-Clean Running.

2. Current Progress

The **Current Progress** section provides real-time monitoring of the pre-cleaning activity.

1. **Processed Weight**
   Displays the total weight of almonds processed by the pre-cleaning equipment so far.

   Example: 527 lbs processed.

2. **Duration**
   Displays the total time elapsed since the job started.

   This helps operators monitor throughput and operational performance during pre-cleaning.

3. **Job Details**

The **Job Details section** displays key information about the load being processed.

Field Name	Description	Example / Values
Grower	Displays the grower associated with the incoming load.	Anderson Farms
Variety	Indicates the almond variety contained in the load.	Nonpareil
Ticket Number	Represents the load ticket associated with the field delivery.	HT-45321-001
Equipment	Displays the pre-cleaning equipment assigned to the job.	Pre-Cleaner #1
Expected Weight	Displays the expected total weight of almonds associated with the ticket.	45,000 lbs

4. Load Tickets

The **Load Tickets section** lists all field load tickets assigned to the pre-clean job.

Each ticket represents a load of almonds delivered from the field.

Field / Function	Description	Example / Values
Ticket Identifier	Displays the unique ticket number associated with the incoming load.	HT-45321-001
Grower	Displays the grower associated with the ticket.	Anderson Farms
Variety	Displays the almond variety associated with the load.	Nonpareil

Load Weight	Displays the total weight of almonds associated with the ticket.	45,000 lbs
Add Ticket	Allows the operator to add additional load tickets to the pre-clean job.	Multiple tickets can be added
Matching Criteria	Ensures that only tickets with the same grower and variety can be added to the job.	Grower + Variety must match
Available Tickets	Displays additional tickets that meet the matching criteria and are available for selection.	List of eligible tickets

5. **Destination Tank**

The **Destination Tank section** specifies the storage tank where the cleaned almonds will be transferred after the pre-clean process.

1. **Tank Identifier**
   Displays the tank number selected as the destination.

   Example: Tank 1.

2. **Tank Code and Location**
   Displays the tank code and the associated plant or facility location.

   Example: TK-T01 – Plant 1.

3. **Change Tank**

   The operator can select a different empty tank if required. Only tanks that are currently empty are available for selection to prevent mixing of inventory.

6. Job Status

The **Status section** displays the current operational state of the job.

Example: In Progress.

The system also records the date when the job was created.

Example: Created – 01/03/2025.

7. Actions
Start Job

Stop Job

The **Stop Job** option allows the operator to stop the pre-clean job before completion if required due to operational issues or process interruptions.

8. Complete Job

The **Complete** button is used when the pre-cleaning process has finished successfully.

When the job is completed:

- The processed almonds are finalized against the selected destination tank.
- The job status changes to Completed.
- The processed weight and associated tickets are recorded in the system.

Production Module (Web)

The Production screen provides users with the ability to monitor, search, filter, and manage production runs. Each production run represents a processing activity where almonds are processed to produce kernel or inshell outputs (along with production rejects such as Hash). The module includes the main screen, creation form and details screen.

Production (Web) - Main Screen

Production (web) main screen includes production summary indicators / metrics, main production listing grid with filtration and sorting on each column (both sorting of columns and column values), search functionality, and columns hide/show options.

1. **Summary Metrics**

Field Name	Description
Total Orders	Displays the total number of production orders currently recorded in the system.
In Progress	Displays the number of production orders that are currently being executed.
Planned	Displays the number of production orders that are scheduled but not started.
Completed	Displays the number of production orders that have been completed.

2. **Production (Web) Main Grid Search**

Allows users to search for production runs using key identifiers. Search will support

- Run Number
- Grower
- Field
- Variety
- Tank#
- Output

3. **Production (Web) Main Grid Filters**

Field Name	Description	Available Values
Status Filter	Filters production runs based on their execution status.	Planned, Pending, In Progress, Completed
Product Type Filter	Filters production runs based on the product type being produced.	Kernel, Inshell
From Date	Defines the start date for filtering production runs.	N/A

To Date	Defines the end date for filtering production runs.	N/A

4. **Production Run Grid**

Field Name	Description	Example / Available Values
Run Number	Unique identifier assigned to each production run.	RUN-00055
Date	Date on which the production run was created or scheduled.	12/29/2024
Created By	Displays the user who created the production run record.	Joyel Ibara
Product	Indicates the type of production activity associated with the run.	Clean Field Run
Output	Specifies the color coded product type generated from the production run.	Kernel, Inshell
Grower	Displays the grower associated with the almonds used in the production run.	Anderson Farms, Vann Brothers, Golden Valley Growers
Field	Represents the specific agricultural field where the almonds were harvested.	Field A-1, Field 14B, Field C-1
Variety	Indicates the almond variety being processed in the production run.	Nonpareil, Butte, Carmel, Fritz
Tank Ticket#	Displays the consumed tank ticket#.	T-001, T-004, T-006
Net Weight	Displays the total weight produced	1,000 Lbs
Status	Displays the color coded status, production run is currently in	

5. **Action Fields**

- New Order: Button used to create a new production order.

Production (Web) - Creation Screen

Field Name	Description	Example / Available Values

Production Date	Specifies the date on which the production run will occur. This is a mandatory field selected via a calendar picker and is used for tracking, reporting, and integration.	03/16/2026
Output Item	Defines the type of product to be produced during the production run. Determines the production flow and output inventory type.	Kernel, Inshell
Product Type	Identifies the packaging or handling format of the produced output. Determines how inventory will be tracked.	Bin, Bulk
Scan Tank Ticket	Allows users to scan or manually enter the tank identifier containing input inventory. Ensures traceability between source inventory and production output.	Tank ID (scanned/manual entry)
Assign Resources	Allows assignment of operational staff responsible for executing the production run. Can be assigned during creation or execution.	David Luke – Machine Operator
Cancel	Closes the screen without saving any entered information.	UI Action
Create Run	Finalizes the setup and creates the production run record for execution.	UI Action

Production (Web) Details Screen

The Production Order (web) details screen provides a detailed view of a specific production run. It allows managers to monitor incoming inventory, track tanks assigned to the run, review processing progress. The screen also displays processed bins and their weight information, ensuring full traceability between input inventory and produced output.

1. **General Details**

The **General Details** section displays key information associated with the production run.

Field Name	Description	Example / Available Values
Handler	Identifies the facility or processing entity responsible for executing the production run.	Central Valley Processing
Grower	Displays the grower associated with the almonds being processed.	Anderson Farms
Field	Represents the agricultural field from which the almonds originated.	Field A-1
Variety	Indicates the almond variety being processed during the production run.	Nonpareil
Run Type	Specifies the type of production process being executed.	Inshell
Load Bins	Displays the number of bins that contain incoming almonds associated with the run.	Numeric value (e.g., 10 bins)
Field Weight	Represents the total weight of almonds received from the field available for processing.	220,000 lbs
Bin Weight	Displays the combined weight of bins produced or associated with the run.	8,822 lbs
Start Date	Displays the date when the production run began or was scheduled.	12/29/2024

2. **Assigned Tanks**

The **Assigned Tanks** section displays the tanks from which almonds will be consumed during the production process. Each tank represents a storage location containing cleaned field-run almonds available for processing.

The following information is displayed for each tank.

Field Name	Description
Tank Number	Identifies the storage tank containing the almonds used as input inventory for the production run.
Ticket Number	Represents the ticket associated with the incoming inventory stored in the tank.
Grower	Displays the grower associated with the almonds stored in the tank.
Field	Indicates the field from which the almonds originated.
Variety	Displays the almond variety contained in the tank.
Net Weight	Represents the available weight of almonds stored in the tank and available for production.
Status	Displays the current usage status of the tank within the production run.

3. **Production Flow**

The **Production Flow** section visualizes the conversion of incoming almonds into produced output during the production process.

Field Name	Description	Example / Values
Incoming Field Run Weight	Displays the total weight of field-run almonds available for processing in the production run.	220,000 lbs
Produced Output Weight	Displays the total weight of almonds produced during the run so far.	8,822 lbs
Field Intake Indicator	Represents the percentage of incoming inventory currently available or consumed during production.	Percentage-based indicator
Active Tanks	Displays the tanks currently supplying almonds to the production process along with their weights.	Tank #1 – 135,000 lbsTank #4 – 30,000 lbsTank #6 – 55,000 lbs

4. Production Yield Metrics

The system calculates performance indicators to monitor production efficiency and compare expected versus actual output

Field Name	Description	Example / Values
Current Turnout	Represents the current production performance relative to expected output levels.	System calculated
Standard Turnout	Displays the expected or benchmark yield percentage for the production process.	80.00%
Actual Yield	Displays the actual output yield generated from the processed input inventory.	4.01%

5. Chutes

The **Chutes section** displays information about bins currently routed through production chutes during processing.

The system displays the number of bins processed through chutes along with their combined weight.

Example:
3 bins – 1,955 lbs.

This helps operators monitor the flow of processed output through the production line.

1. **Processed Bins**

The **Processed Bins for Run** section lists all bins or containers generated during the production run. Each row represents a container of processed almonds along with its associated weight and status.

Field Name	**Description**	**Example / Available Values**
Sequence Number	Identifies the order in which bins were produced during the production run.	1, 2, 3
Container ID	Displays the unique identifier assigned to the physical container or trailer.	CNT-001, TRL-045
Bin ID	Represents the system-generated identifier used to track the bin.	BIN-000123
Product	Displays the type of product contained in the bin.	Inshell, Kernel
Bin Type	Indicates the type of container used for the produced inventory.	Bin, Bulk (Trailer)

Chute	Displays the production chute through which the bin was processed.	Chute-1, Chute-2
Tare Weight	Represents the weight of the empty container before product is added.	200 lbs
Gross Weight	Displays the total weight of the container including the product.	1,200 lbs
Net Weight	Represents the actual product weight after subtracting tare from gross weight.	1,000 lbs
Status	Displays the current status of bin weight capture.	Pending Weight, Completed
Date	Displays the date when the bin record was created or processed.	01/02/2025
Time	Displays the timestamp associated with the bin processing activity.	10:45 AM
Update Weight	Allows the user to capture or update bin weight using the scale.	UI Action

Production Module (Kiosk/Tablet)

The **Production Dashboard** provides floor supervisors and operational staff with a real-time overview of active production activities. The screen summarizes current production workload, displays the total bins produced, and lists all active and planned production runs. This interface enables supervisors to monitor running operations, track production output, and quickly access individual production runs for further execution or review.

Production Main Screen - Kiosk/Tablet

1. **Production Orders Grid View**

The **Production Orders grid view** section lists all production runs currently available in the system. Each production order entry provides key information about the production activity, including the run identifier, production status, grower information, variety, produced quantity, and date.

Field Name	Description	Example / Available Values
Run Number	Uniquely identifies a production run and serves as the primary tracking reference.	RUN-00055, RUN-00056, RUN-00057
Run Status	Indicates the current stage of the production process.	Running, Planned
Bin Count	Displays the number of bins produced so far in the run (for active runs).	2 bins, 6 bins
Variety	Indicates the almond variety being processed in the production run.	Nonpareil, Butte
Grower	Displays the grower associated with the almonds being processed.	Anderson Farms, Vann Brothers, Golden Valley Growers
Produced Quantity	Displays the total quantity produced during the run (in lbs).	24,005 lbs, 18,200 lbs, 12,500 lbs
Production Date	Displays the date the production run was created or scheduled.	12/29/2024, 12/30/2024, 01/02/2025
Run Details Navigation	Provides access to the detailed production run screen for execution and monitoring.	Navigation arrow (UI action)

Production Detail Screen - Kiosk/Tablet

Production Run Execution Screen

The **Production Run Execution screen** is used by the floor supervisor or operator to manage and monitor an active production run. This screen provides real-time visibility into the tanks supplying almonds for processing, the chutes generating output, and the weighing station used to capture bin weights. It serves as the primary operational interface during the execution of a production run.

1. **Production Run Header**

The header section displays basic information about the production run currently being executed.

Field Name	Description	Example / Values
Run Number	Displays the unique identifier assigned to the production run.	RUN-00055
Status	Indicates the current status of the production run.	Running
Grower and Variety	Displays the grower and almond variety associated with the production run.	Anderson Farms – Nonpareil
Bins Produced	Displays the total number of bins generated during the production run.	Numeric value (e.g., 12 bins)
Total Weight Produced	Displays the cumulative weight of all produced bins captured during the run.	8,822 lbs
Scan Tank	Allows the user to scan or assign an additional tank to the production run.	UI Action

Stop	Allows the user to stop or close the active production run.	UI Action

2. Run Information

The **Run Information section** provides high-level details about the almonds being processed.

Field Name	**Description**	**Example / Values**
Handler	Displays the facility responsible for processing the almonds.	Central Valley Processing
Grower	Indicates the grower associated with the almonds in the production run.	Anderson Farms
Field	Displays the field from which the almonds originated.	Field A-1
Variety	Identifies the almond variety being processed.	Nonpareil
Product	Displays the product type produced during the run.	Inshell
Bin Type	Indicates the type of container used for collecting produced almonds.	Bin

3. Assigned Tanks

The **Assigned Tanks section** lists the tanks that currently supply almonds to the production run. Each tank represents a storage location containing cleaned almonds ready for processing.

The following information is displayed for each tank.

Field Name	Description	Example / Values
Tank Number	Identifies the storage tank supplying almonds to the production process.	Tank #1
Ticket Number	Represents the load ticket associated with the almonds stored in the tank.	HT-45321-001
Grower	Displays the grower associated with the almonds stored in the tank.	Anderson Farms
Field	Indicates the field from which the almonds originated.	Field A-1
Variety	Displays the almond variety stored in the tank.	Nonpareil
Net Weight	Represents the total weight of almonds available in the tank.	135,000 lbs
Status	Indicates the usage status of the tank within the production run.	In Use
Close	Allows the operator to close the tank when its inventory is fully consumed.	UI Action
Remove	Allows the operator to remove the tank from the production run.	UI Action

4. Chutes

The **Chutes section** represents the different output streams generated during the production process. Each chute corresponds to a specific product type or reject category produced by the processing line.

Examples of chute types include:

1. **Production Chutes**
   These chutes represent the primary output streams that generate saleable product such as inshell or kernel almonds. Output from these chutes is typically collected in bins or trailers.
2. **Rejects – 3U**
   Represents oversized rejects separated during processing. These are typically weighed manually.
3. **Rejects – Hash**
   Represents broken or fragmented almond material separated during processing.
4. **Rejects – Dust**
   Represents dust or very fine material separated during cleaning or cracking operations.

   Each chute card indicates the type of material it produces and whether weight capture is manual or scale-driven.

5. **Weighing Station**

The **Weighing Station** panel is used to capture bin weights during the production process.

1. **Scale Connection Status**
   Displays whether the weighing scale is connected to the system.
2. **Weight Display**
   Shows the current weight reading from the scale.
3. **Scan Container Bin**
   Allows the operator to scan the barcode of the container or bin placed on the scale.

Once the container is scanned, the system captures the following sequence:

1. **Scan**
   The container barcode is scanned to identify the bin.
2. **Tare**
   The empty container weight is captured.
3. **Gross**
   The total weight of the container including the product is captured.
4. **Net**
   The system calculates the net product weight by subtracting the tare weight from the gross weight.

   This process ensures accurate weight recording for each produced bin.

6. Production Status Indicator

At the bottom of the screen, the **Production Running indicator** displays the current operational status of the production run.

If production needs to be stopped, the user can select the **Stop Production** button, which ends the active production run and finalizes the associated production records.
